

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

WARNING

HIGH VOLTAGE

is used in the operation of this equipment

DEATH ON CONTACT

may result if personnel fail to observe safety precautions

Never work on electronic equipment unless there is another person nearby who is familiar with the operation and hazards of the equipment and who is competent in administering first aid. When the technician is aided by operators, he must warn them about dangerous areas.

Whenever possible, the power supply to the equipment must be shut off before beginning work on the equipment. Take particular care to ground every capacitor likely to hold a dangerous potential. When working inside the equipment, after the power has been turned off, always ground every part before touching it.

Be careful not to contact high-voltage connections or 115 volt ac input connections when installing or operating this equipment.

Whenever the nature of the operation permits, keep one hand away from the equipment to reduce the hazard of current flowing through the body.

Warning: Do not be misled by the term "low voltage." Potentials as low as 50 volts may cause death under adverse conditions.

For Artificial Respiration, refer to FM 21-11.

SAFETY SUMMARY

The following are general safety precautions that are not related to any specific procedures and therefore do not appear elsewhere in this publication. These are recommended precautions that personnel must understand and apply during many phases of operation and maintenance.

KEEP AWAY FROM LIVE CIRCUITS

Operating personnel must at all times observe all safety regulations. Unless specifically directed in this manual, do not replace components or make adjustments inside the equipment with any power supply turned on. Under certain conditions, dangerous potentials may exist in the power supplies when the power control is in the off position. To avoid casualties, always remove power and discharge and ground a circuit before touching it.

DO NOT SERVICE OR ADJUST ALONE

Under no circumstances should any person reach into or enter the enclosure for the purpose of servicing or adjusting the equipment except in the presence of someone who is capable of rendering aid.

RESUSCITATION

FIRST AID

Each person engaged in electrical operations will be trained in first aid, particularly in the technique of mouth to mouth resuscitation and closed chest heart massage (FM 21-11).

The following warnings appear in this volume, and are repeated here for emphasis.

WARNING

A 3-wire (line, neutral, and safety ground) AC line power connections is required when operating the equipment. If a 3-wire safety grounded AC power receptacle is not available, a separate ground wire must be installed from the chassis ground to an earth ground. Without an adequate ground, the equipment chassis and frame will float to a dangerously high potential.

WARNING

Lethal voltage is used in the operational checkout of this unit. Death on contact may result if personnel fail to observe the following safety precautions. Remove watches and rings and exercise extreme caution when working inside the equipment throughout the remainder of this procedure.

WARNING

Prior to performing the following functions all electrical power is to be removed from the system. External power disconnected and a "MAINTENANCE IN PROGRESS" tag attached or power switches will be locked out to prevent inadvertent energizing of the system.

WARNING

Lifting heavy equipment incorrectly can cause serious injury. Do not try to lift more than 35 pounds by yourself. Get a helper. Bend legs while lifting. Don't support heavy weight with your back.

WARNING

Adequate ventilation should be provided while using TRICHLOROTRIFLUOROETHANE. Prolonged breathing of vapor should be avoided. The solvent should not be used near heat or open flame, the products of decomposition are toxic and irritating. Since TRICHLOROTRIFLUOROETHANE dissolves natural oils, prolonged contact with skin should be avoided. When necessary use gloves which the solvent cannot penetrate. If the solvent is taken internally, consult a physician.

Compressed air shall not be used for cleaning purposes except where reduced to less than 29 psi and then only with effective chip guarding and personnel protective equipment. Do not use compressed air to dry parts when TRICHLOROTRIFLUOROETHANE has been used. Compressed air is dangerous and can cause serious bodily harm if protective means or methods are not observed to prevent chip or particle (of whatever size) from being blown into the eyes or unbroken skin of the operator or other personnel.

SAFETY SUMMARY

The following warnings and cautions appear within the text or illustrations of this manual. The warnings or cautions include a paragraph, figure or table reference to where they appear in text or illustrations.

CAUTION

Press relief valve button to equalize pressure before unlatching transit case. (1-25)

WARNING

Do not store or transport batteries in the closed transit case, or in a closed environment, for extended periods after they are activated (filled with electrolyte). An explosive mixture of hydrogen and air may result. (1-25, 1-31)

WARNING

Be extremely careful with incendiary devices and explosives. Use these items only when other means are not adequate. (1-34)

WARNING

Ensure work area is free from open flame, sparks, high voltage, and high rf, and that area is well ventilated.

WARNING

Personnel filling the batteries or otherwise handling the electrolyte should read the precautions outlined below to assure maximum safety and prevent injury which may result from accidental spillage of electrolyte. The electrolyte (a strong solution of potassium hydroxide) is alkaline and corrosive. It should be handled with care. If neglected, the electrolyte will cause serious burns when it is permitted to come in contact with the eyes or skin. Alkali-proof apron, rubber gloves, and splash-proof goggles or face mask are recommended for personnel engaged in the handling of the electrolyte.

Ordinarily, no trace of the alkaline electrolyte appears on the outside of the case of filled cells. However, personnel working with the batteries should wash their hands thoroughly after handling them. If the electrolyte is accidentally spilled it can be readily neutralized and washed away.

ANTIDOTES, INTERNAL

Give large quantities of water and a weak acid solution such as vinegar, lemon juice, or orange juice, followed with one of the following: white of egg, olive oil, starch water, mineral oil, or melted butter. Obtain medical attention at once.

ANTIDOTES, EXTERNAL

For the skin: Wash the affected area with large quantities of water. Neutralize with vinegar, lemon juice, or 5-percent acetic acid and wash with water. Obtain medical attention at once.

For the eyes: Flush thoroughly with water. Follow with saturated solution of boric acid. Use this first-aid treatment until medical aid can be summoned.

SAFETY SUMMARY (Continued)

CAUTION

Do not charge or discharge battery without a battery restrainer (such as filament-reinforced adhesive tape), or permanent damage will result to the battery from expansion.

WARNING

While charging, the battery voltage should not be allowed to exceed 31v during 400-milliamperes charging rate, or 32v during 100-milliamperes charging rate. If charging is continued above 31v or 32v respectively, it will cause excessive gassing, loss of electrolyte, and impaired battery life.

CAUTION

If there are gross differences in charging states between cells, the charging procedure will damage the charged cells.

CAUTION

Ensure that filling vent-well of each cell is clean and free of dirt, and do not allow any dirt to enter the cell during the filling operation.

CAUTION

After filling, the dry-charge storage battery may evidence swelling perpendicular to the electrode face. The swelling may cause difficulties in subsequent cell replacement into the battery case; if excessive, it may also impair cell performance, and sometimes cause cell cases to crack. To avoid swelling, the cells should be kept restrained with filament-reinforced adhesive tape at all times.

WARNING

Electrolyte will splash if the filling bottle is not firmly seated in vent-well, or if the filling bottle is squeezed too rapidly.

WARNING

As soon as the electrolyte (KOH) is added to the cells, they must be handled as fully charged cells; therefore, exercise extreme care to avoid shorting the cells with any metallic object or other conductive material.

WARNING

While charging, the battery voltage should not be allowed to exceed 32v during 100-milliamperes charging rate. If charging is continued above 32v, it will cause excessive gassing, loss of electrolyte, and impaired battery life.

SAFETY STATEMENT FOR BATTERY BA-5590/U

INTRODUCTION

The purpose of this statement is to identify safety features and precautionary procedures to be followed by personnel using Battery BA-5590/U.

DESCRIPTION

The BA-5590/U primary battery is a high-energy power source that contains lithium metal, sulfur dioxide, and organic solvents under pressure (30-60 psia at 70°F) in hermetically sealed stainless steel cells. The contents are potentially flammable and/or noxious. Dimensions are 4.40 x 2.45 x 5.00 inches. Weight is 2.5 pounds.

SAFETY FEATURES

The BA-5590/U battery can be electrically arranged to provide 12 or 24 volts. This dual voltage capability is achieved through the use of a specially designed connector which makes the proper voltage connection upon mating with the equipment.

The battery is protected by a 3.2 ampere slow blow replaceable fuse in each 12 volt section to protect against excessive currents or external short circuits which could lead to overheating, cell venting, or rupture. This fuse should not be bypassed or replaced with a higher rated fuse.

Each cell (ten per BA-5590/U) is designed with a venting device which releases internal cell pressure to ambient pressure if the internal pressure exceeds 350-450 psia. Venting will occur when pressures become excessive due to cells which have overheated (200-220°F) and serves to prevent the cell from rupturing. If a cell vents, sulfur dioxide gas will be released, which is a noxious eye and respiratory irritant. Irritation will occur long before toxic concentrations are reached and serves as an indication of its (SO₂) presence. This battery contains no radioactive material.

WARNING

DO NOT USE unauthorized batteries or damaged batteries, and dispose of any batteries showing signs of damage.

WARNING

DO NOT USE lithium batteries in parallel circuitry unless the batteries or equipment are diode protected.

PRECAUTIONS

Storage: Bulk storage of BA-5590/U batteries should be in a well ventilated, cool temperature facility. Refrigeration is not required. Battery life decreases with storage time and with increasing temperature. For this reason temperatures above 130°F should be avoided if possible.

Handling: The BA-5590/U battery contains pressurized cells similar to aerosol cans. Therefore, under no circumstances should the battery be deliberately opened, crushed, punctured, disassembled or otherwise mutilated. Rupture of the cell could occur.

The BA-5590/U battery should not be heated or incinerated, as overheating may produce internal pressure at a rate in excess of the venting capacity and could result in a cell or battery rupturing.

Under no condition should the batteries be recharged. Such action could lead to venting, rupturing, or rupturing with fire.

Transportation: Shipment of the BA-5590/U battery is regulated by the Department of Transportation in their Exemption 7052 and by the Department of the Army in TM 38-250.

CAUTION

Disposal: Batteries are considered hazardous waste. Contact local property disposal officer for disposal instructions.

Overheating: In the unlikely event that an equipment operator detects the battery compartment becoming unduly hot, hears cells venting (hissing sound) or smells the irritating sulfur dioxide, he should immediately do the following:

1. Turn off equipment.
2. Remove equipment or leave immediate area of equipment and do not approach for 12 hours.
3. Carefully remove the battery from the equipment and place away from area of operation, after 12 hours.

Fire: In the event there are fires in which lithium batteries are involved, they are generally extinguishable with water in sufficient amounts so as to "flood" the burning materials. This will not only tend to cut off air access to the fire, but will cool down the batteries and surrounding combustibles so that cell venting and burning are minimized. If many cells have ruptured, lithium metal may be exposed. Burning lithium metal may respond satisfactorily to treatment with water. However, if not, efforts should be aimed at preventing the spread of the fire to other combustibles while letting the lithium metal burn itself out. Carbon dioxide extinguishers will not extinguish burning lithium metal but will extinguish other combustible materials within or near the battery.

Voltage Delay: If there is a delay in the operation of the equipment that exceeds two minutes, the battery should be replaced.

Remove the battery when the equipment does not operate properly and replace with a new battery.

Battery Removal: When equipment will not be used within 30 days, the battery should be removed from the equipment.

SECTION 0

GENERAL

0-1. SCOPE. This manual covers Radio Set AN/PRC-104(A). This manual provides instructions for general support maintenance. Throughout this manual AN/PRC-104 should be AN/PRC-104(A).

0-2. CONSOLIDATED INDEX OF ARMY PUBLICATIONS AND BLANK FORMS. Refer to the latest issue of DA Pam 310-1 to determine whether there are new editions, changes or additional publications pertaining to the equipment.

0-3. MAINTENANCE FORMS, RECORDS, AND REPORTS

a. Reports of Maintenance and Unsatisfactory Equipment. Department of the Army forms and procedures used for equipment maintenance will be those prescribed by DA Pam 738-750 as contained in Maintenance Management Update.

b. Report of Packaging and Handling Deficiencies. Fill out and forward SF 364 (Report of Discrepancy (ROD)) as prescribed in AR 735-11-2/DLAR 4140.55/NAVMATINST 4355.74A/AFR 400-54/MCO 4430.3F.

c. Discrepancy in Shipment Report (DISREP) (SF 361). Fill out and forward Discrepancy in Shipment Report (DISREP) (SF 361) as prescribed in AR 55-38/NAVSUPINST 4610.33C/AFR 75-18/MCO P4610.19/DLAR 4500.15.

0-4. REPORTING EQUIPMENT IMPROVEMENT RECOMMENDATIONS (EIR). If your Radio Set AN/PRC-104(A) needs improvement, let us know. Send us an EIR. You, the user, are the only one who can tell us why you don't like the design. Put it on an SF 368 (Quality Deficiency Report). Mail it to Commander, US Army Communications-Electronics Command and Fort Monmouth, ATTN: AMSEL-ME-MP, Fort Monmouth, New Jersey 07703-5007. We'll send you a reply.

0-5. ADMINISTRATIVE STORAGE. Administrative Storage of equipment issued to and used by Army activities will have preventive maintenance performed in accordance with the PMCS charts before storing. When removing the equipment from administrative storage the PMCS should be performed to assure operational readiness. Disassembly and repacking of equipment for shipment or limited storage are covered in TM 740-90-1.

0-6. DESTRUCTION OF ARMY ELECTRONICS MATERIEL. Destruction of Army electronics materiel to prevent enemy use shall be in accordance with TM 750-244-2.

Figure 1-0. Radio Set AN/PRC-104

CHAPTER 1

GENERAL INFORMATION

SECTION I

GENERAL INFORMATION

1-1. SCOPE OF THE TECHNICAL MANUAL.

1-2. This technical manual provides operator's and organizational maintenance information covering Radio Set AN/PRC-104 (radio set). The information includes operating instructions, installation and setup, theory of operation and maintenance data. Additionally, the propagation of radio waves in the high frequency (hf) radio spectrum is discussed relative to optimizing communications with this radio set. Complete coverage for Battery Case CY-7875/PRC-104 (battery pack) is provided in this manual, because the battery pack is maintained entirely at the organizational level.

1-3. Complete coverage of the radio set, including Receiver-Transmitter RT-1209/URC (receiver/exciter) and Radio Frequency Amplifier AM-6874/PRC-104 (amplifier/coupler), for field and depot levels of maintenance is provided in the following manuals:

1. General Support Maintenance Manual TM 11-5820-919-40-1. Contains reference data, theory of operation and disassembly and reassembly for the complete radio set. It also provides test troubleshooting, alignment and repair data for the radio set and the receiver/exciter and amplifier/coupler units necessary to replace unit components and modules.
2. General Support Maintenance Manual TM 11-5820-919-40-2. Contains maintenance prints for the radio set, units and modules. Maintenance prints include all schematics; power distribution; component location; test and alignment setup; performance test and alignment required for complete field maintenance of the radio set.
3. Rebuild Standards RS-07748A-50/4. Contains depot-unique repair and rebuild data for the radio set that is not covered in the field maintenance manuals.

4. Repair Parts and Special Tools List TM 11-5820-919-24P. Contains complete parts ordering data for all levels of radio set maintenance.

1-4. Chapter 1 of this technical manual provides general reference data and information on the physical aspects and technical characteristics of the radio set. It also covers setup, initial checkout, and demolition to prevent enemy use. Chapter 2 contains operating instructions, and also discusses various operating environments for optimizing communication. Chapter 3 provides system and functional theory of operation. Chapter 4 contains maintenance instructions including preventive maintenance, troubleshooting, and repair down to replacement of units and accessories. Appendix I, at the back of this manual, contains a list of abbreviations used. Appendix II provides a discussion of hf radio wave propagation and gives situational examples for optimizing communications. Appendix III provides instructions for use of the dipole antenna kit.

1-5. EQUIPMENT DESCRIPTION.

1-6. INTRODUCTION. The AN/PRC-104 is a state-of-the-art lightweight radio transceiver that operates in the high frequency (hf) and upper part of the low frequency (lf) portions of the radio spectrum. The receiver/transmitter circuits can be tuned to any frequency between 2.0000 and 29.9999 MHz in 100 Hz increments, making it possible to tune up to 280,000 separate frequencies. The radio set operates in the upper sideband (USB) or lower sideband (LSB) modes for voice communications, CW for morse code, or frequency shift keying (FSK) for transmission of teletype or other data. In the man-pack configuration the radio set is designed to be carried and operated by one man or, with the proper accessories, can be configured for vehicular or fixed station use.

1-7. The control panel has been human-engineered for ease of operation making it possible to adjust all controls even while wearing heavy gloves. Unlike older similar radio sets, there are no front panel meters or indicator lights on the AN/PRC-104. All functions which formerly required these types of indicators (antenna tuning, battery condition, etc.) are monitored by the radio itself and communicated to the operator as special tones in the handset. This feature is particularly useful during tactical black-out operations. The superior design and innovative features of the AN/PRC-104 radio set now make it possible to maintain a reliable long-range communications link using lightweight, portable equipment that can be operated by personnel with a minimum of training.

1-8. RELATIONSHIP OF AN/PRC-104 EQUIPMENTS (Figures 1-1 and 1-2).

1-9. **Radio Set.** The Radio Set AN/PRC-104 (radio set) consists of three units: low-power Receiver-Transmitter RT-1209/URC (receiver/exciter), 20-watt Radio Frequency Amplifier AM-6874/PRC-104 (amplifier/coupler), and Battery Case CY-7875/PRC-104 (battery pack). Quick-disconnect latches secure the receiver/exciter to the amplifier/coupler, and each is latched to one end of the battery pack. When latched together, the receiver/exciter is electrically interconnected with the amplifier/coupler via a built-in connector; the battery pack power is connected to the amplifier/coupler. All operator controls and connections are located on the receiver/exciter front panel, except for the antenna select switch and antenna connections which are on the amplifier/coupler front panel. The receiver/exciter and amplifier/coupler units are constructed on a die-cast aluminum housing; the battery pack housing is tough plastic. Watertight seals for the covers and panels make the three units watertight, submersible, and capable of rough handling and abuse of any field environment. The unit circuits are modular for ease of repair. The total weight of the assembled AN/PRC-104 (three units with battery) is 14 pounds, making a lightweight and easily carried package.

1-10. **Manpack Operation.** The basic manpack configuration consists of the radio set (three units), a whip antenna and an audio input/output device. Antenna AT-217A/PRC is a 10-foot standard whip antenna that screws into Spring Section Antenna AB-129/PR (shock mount) which in turn screws into the antenna mount on the amplifier/coupler. The whip

antenna will be adequate for most short range requirements (less than 10 miles). Two standard input/output devices come with the radio set: **Handset H-189/GR** (handset) and **Telegraph Key KY-872/PRC-104**. These are attached to either of the two AUDIO connectors on the receiver/exciter. The radio transmitter (exciter) is enabled (keyed) by the handset push-to-talk (PTT) button or depressing the telegraph key to contact. The receiver is operative only when the transmitter disabled; therefore, communication is on a one-way reversible (half-duplex) basis. The radio set with whip and handset weighs 15.7 pounds.

1-11. **Battery Pack.** The radio set operates from a nominal 28-volt dc battery pack, with acceptable voltage input between 20 and 32 vdc. The battery pack consists of 16 silver-zinc storage battery cells, inside the battery case. It is normally latched to the other two units, but may also be connected to the amplifier/coupler via the 3-foot Electrical Power Cable Assembly CX-13031/PRC-104 (battery extender cable). This connection permits the battery pack to be carried by the operator under the protection of cold weather clothing to extend battery operating life. Normal life of the battery pack is approximately 16 hours of operation, assuming 10 percent transmit time. The silver-zinc battery pack is charged using Battery Charger PP-6241/U via the battery charger cable, Electrical Power Cable Assembly CX-13032/PRC-104. For maintenance or operation of the radio set without the battery pack, a dc power source can be connected to the amplifier/coupler via the bench test cable, Electrical Power Cable Assembly CX-13030/PRC-104.

1-12. In the manpack configuration, the radio set and accessories are carried in the military standard ALICE backpack (All-Purpose Lightweight Individual Carrying Equipment). The backpack may be used to carry spare battery packs and other accessories.

1-13. **Fixed-Site Operation.** When the tactical situation permits, the effective range of the AN/PRC-104 may be extended by utilizing Antenna AS-2259/GR, the 15-foot near-vertical incidence skywave (NVIS) antenna, or a simple half-wave dipole. Two-foot long Radio Frequency Cable Assembly CG-3815/V (antenna base cable) is used to connect the NVIS Antenna Base AB-1241/PRC-104 to the BNC jack of the amplifier/coupler.

Figure 1-1. Radio Set AN/PRC-104 Equipment Supplied (Sheet 1 of 2)

Figure 1-1. Radio Set AN/PRC-104 Equipment Supplied (Sheet 2 of 2)

Figure 1-2. Relationship of Radio Set AN/PRC-104 Equipments

Figure 1-3. Manpack Operation

1-14. The radio set and accessory equipments are supplied and transported in Radio Set Case CY-8291/PRC-104 (transit case). All accessories, except the NVIS antenna and the battery charger, are supplied as standard equipment in the transit case, together with the radio set.

1-15. REFERENCE DATA.

1-16. The following paragraphs provide the reference data for the radio set and accessory equipment.

1-17. TECHNICAL CHARACTERISTICS. Technical characteristics for the radio set are listed in table 1-1.

1-18. EQUIPMENT SUPPLIED. The radio set and accessory equipment that are supplied in the transit case are listed in table 1-2 and shown in figure 1-1.

1-19. EQUIPMENT NOT SUPPLIED. Table 1-3 lists the equipment that may be used with the radio

set, but is not supplied in the transit case.

1-20. SUPPORT EQUIPMENT. The test equipment required to perform organizational maintenance of the radio set is listed in table 1-4. Equivalent test equipment may be used.

NOTE

Use only test equipment that is properly calibrated. Failure to do so may provide erroneous and misleading performance or fault indications.

1-21. LIST OF PUBLICATIONS. Table 1-5 lists the current publications applicable to the radio set. Publication numbers beginning with TM are for Marine Corps technical manuals; those beginning with TO are for Air Force technical orders. Joint service publications carry both TM and TO publication numbers.

TABLE 1-1. TECHNICAL CHARACTERISTICS

Characteristic	Description
RADIO SET AN/PRC-104 (Radio Set)	
Frequency Range	2.0000 to 29.9999 MHz in. 0.0001 MHz (100 Hz) increments (280,000 possible frequency settings)
Frequency Accuracy	± 1 ppm for -51°F (-46°C) to $+160^{\circ}\text{F}$ ($+71^{\circ}\text{C}$) (± 2 to 30 Hz of setting) from 2 to 30 MHz respectively.
Operating Modes	<ul style="list-style-type: none"> – Single sideband (selectable USB or LSB) – Voice/cw (Morse or burst cw at 300 wpm) – Data (FSK or DPSK up to 2400 bps) compatible with 75 baud military teletype – Receive only (inhibits transmit operation)
Audio Input Impedance and Level	150 ohms, -56 dbm (voice) 600 ohms, 0 dbm (data)
RF Output Power	20w (PEP), 0.25w (PEP) exciter output
RF Output Impedance	50-ohms, unbalanced. Output protected to infinite VSWR due to antenna short or open
Antenna Tuning	Automatic to 1.5:1 VSWR (3 seconds tuning time, typical)
Power Requirements	20.0 to 32.0 vdc; 3.5 amp at 24.0 vdc for transmit; 200 ma for receive
Operating Temperature Range	-51°F (-46°C) to $+160^{\circ}\text{F}$ ($+71^{\circ}\text{C}$)
Environmental	Meets applicable provisions of MIL-STD-810B
Mean Time Between Failure (MTBF)	2500 hours (demonstrated per MIL-STD-785)
Mean Time to Repair (MTTR)	15 minutes (module replacement)
Dimensions	12-1/2" x 10 1/2" x 2 5/8" (31.75 cm x 26.67 cm x 6.66 cm) D x W x H
Weight	14 pounds (6.36 kg), including 4.8 AH silver-zinc battery (without accessories).

TABLE 1-1. TECHNICAL CHARACTERISTICS (Continued)

Characteristic	Description
RECEIVER	
Sensitivity	
SSB, CW, FSK	0.7 μ v for 10 db SINAD
Selectivity	
SSB	2.5 kHz Bandwidth at -3 db
	6 kHz Bandwidth at -60 db
Image Rejection	70 db
I.F. Rejection	60 db
Audio Output	25 mw into 500 Ω (nominal)
Audio Distortion	5% at 5 mw, 350 to 3000 Hz
Desensitization (signal to degrade SINAD 3 db)	$\pm 2.5\%$ to -29 dbm; $\pm 10\%$ to -15 dbm; $\pm 50\%$ to + 17 dbm
TRANSMITTER	
RF Output Power	0.25w (PEP) for RT-1209, 20w ± 2 db (PEP or average) with AM-6874
Duty Cycle	1 minute continuous keydown 9:1 transmit/receive ratio
Intermodulation Distortion (IMD)	-25 db (two equal tones at rated output power)
Harmonic Radiation	-50 db
Carrier Suppression	-42 db
Unwanted Sideband Suppression	-45 db
All Other Spurious	-45 to -60 db
BATTERY PACK	
Batteries	Primary, Lithium or Storage, NICAD

TABLE 1-2. EQUIPMENT SUPPLIED

Nomenclature	Manufacturer's Part Number	Common Name	Overall Dimensions	Weight
Case, Radio SET CY-8291/PRC-104A		transit case	14.5 in. (36.83 cm) wide 15.25 in. (38.74 cm) high 22.0 in. (55.88 cm) long	28.0 lb (12.70 kg)
Radio Set AN/PRC-104A	75502A0050	radio set	12.5 in. (31.75 cm) wide 10.5 in. (26.67 cm) high 2.62 in. (6.66 cm) deep	14 lb (6.36 kg) (3 units, including battery)
Receiver-Transmitter RT-1209/URC	75502A0150	receiver/exciter	7.25 in. (18.42 cm) wide 7.25 in. (18.42 cm) high 2.62 in. (6.66 cm) deep	5.9 lb (2.68 kg)
Amplifier, Radio Frequency AM-6874/PRC-104	755002A0550	amplifier/coupler	5.25 in. (13.34 cm) wide 7.25 in. (18.42 cm) high 2.62 in. (6.66 cm) deep	4.1 lb (1.86 kg)
Case, Battery CY-7875/PRC-104A		battery pack	12.5 in. (31.75 cm) wide 3.25 in. (8.26 cm) high 3.25 in. (8.26 cm) deep	4.0 lb (1.81 kg) (including battery)

SECTION II

PREPARATION FOR USE

1-22. TRANSPORTATION AND STORAGE (Figure 1-1).

1-23. The radio set and standard accessories are contained, transported and stored in Radio Set Case CY-8291/PRC-104 (transit case). The transit case should normally be kept closed. To unpack the equipment, unfasten the four latches and remove the transit case cover. Each of the individual pieces of equipment fit in a molded space, as shown in figure 1-1. Check that the equipment is complete and inspect the equipment for any damage incurred during shipment.

1-24. INSTALLATION AND SETUP (Figure 1-4).

1-25. Installation and setup of the radio set is accomplished as follows.

CAUTION

Press relief valve button to equalize pressure before unlatching transit case.

1. Unfasten the 4 latches securing the cover to the transit case and remove cover.

2. Remove the receiver/exciter — amplifier/coupler combination from the transit case.

3. Remove one of the three (3) battery packs from the transit case. For initial battery filling, refer to paragraph 4-36. For battery charging, refer to paragraph 4-42.

WARNING

Do not store or transport batteries in the closed transit case, or in a closed environment, for extended periods after they are activated (filled with electrolyte). An explosive mixture of hydrogen and air may result.

4. Attach the activated battery pack to the bottom of the receiver/exciter amplifier/coupler units using the latches.

5. Remove the whip antenna from the transit case and assemble.

6. Attach the whip antenna to antenna shock mount.

7. Attach the antenna shock mount (with whip antenna attached) to the amplifier/coupler antenna socket. The radio is now ready for initial checkout.

1-26. INITIAL CHECKOUT.

1-27. Perform the following test procedure for initial checkout of the radio set in an operating environment. If any of the results are abnormal, refer to the troubleshooting procedure in chapter 4. Refer to figure 2-1 for location of controls and indicators.

1-28. PRELIMINARY SETUP.

1. Connect a handset to the radio set.

2. Set the radio set controls as follows:

a. MODE to V-TR

b. ANT/SEL to whip connection position

c. FREQUENCY-KHZ to 02,221.2 (USB)

d. VOLUME — Desired listening level. (If a clicking sound is heard, this indicates that the battery voltage is low (20v or less) and should be replaced or recharged. Refer to paragraph 4-42.

1-29. TEST PROCEDURE.

1. Momentarily press the handset PTT switch. Verify that the handset emits a 1-kHz sidetone which terminates in less than 12 seconds. This indicates the automatic antenna tuner is operating normally. Failure of the antenna to tune properly is indicated by continuous, rapid beeping in the handset (fault tone).

2. Transmit, using a handset. If possible, communicate with base station at this test frequency. Presence of a sidetone indicates transmission is

Figure 1-4. Radio Set Installation and Setup

satisfactory. If fault tone occurs, refer to the radio troubleshooting procedure in chapter 4.

3. Repeat steps 1 and 2 for the other test frequencies listed below:

3,334.3 kHz LSB
6,665.6 kHz USB
8,889.8 kHz LSB
15,554.5 kHz USB
27,778.7 kHz LSB

4. Select a frequency for the time standard broadcast (multiples of 5.000 MHz, eg: 5, 10, 15, 20, 25 MHz). For this test, one frequency may be better than another depending on the time of day and location. Some may not work at all, so try several if necessary to get a good signal.

5. Monitor the time standard broadcast and switch sidebands. Verify that the pitch of the audible signals does not change, indicating the frequency accuracy of the radio set is within specifications.

6. Turn the radio off. Test is complete.

1-30. DISASSEMBLY AND PACKUP.

1-31. To transport the radio set, place all equipment (except activated batteries) back in the transit case (fig 1-1) as follows.

WARNING

Do not store or transport batteries for an extended period in the transit case, or in a closed environment, after they are activated (filled with electrolyte). An explosive mixture of hydrogen and air may result.

1. Remove the antenna and shock mount from the radio set.

2. Remove the antenna shock mount from the antenna and place in the space provided in the transit case.

3. Fold the antenna and place in the space provided in the transit case.

4. Remove the activated battery packs and transport separately from the transit case. Only battery packs that are not activated may be placed in the transit case.

5. Place the receiver/exciter and amplifier/coupler combination in the transit case.

6. Place all other accessories in the transit case.

7. Replace the transit case cover and fasten the four latches.

SECTION III

DEMOLITION TO PREVENT ENEMY USE

1-32. GENERAL.

1-33. When capture or abandonment of the radio set to an enemy is imminent, the responsible unit commander will make the decision to either destroy the equipment or render it inoperative and issue orders which cover the desired extent of destruction.

1-34. When authorized, use any of the following methods to destroy the radio set:

1. **Smash.** Smash the controls, and minor components; use sledges, axes, hand axes, pickaxes, hammers, or crowbars.
2. **Cut.** Cut all power cables; use axes, hand axes, or machetes.

3. **Bend.** Bend the panel and cabinet.

WARNING

Be extremely careful with incendiary devices and explosives. Use these items only when other means are not adequate.

4. **Burn.** Burn cables, cords and technical manuals; use gasoline, kerosene, oil, flame-throwers, or incendiary grenades.
5. **Explode.** If explosives are necessary, use firearms, grenades.
6. **Dispose.** Bury or scatter the destroyed parts in slit trenches or foxholes, or throw them into nearby streams.

CHAPTER 2

OPERATING INSTRUCTIONS

2-1. INTRODUCTION.

2-2. This chapter contains the necessary information for operation of the radio set. It also discusses operating considerations essential for achieving optimum results in various operating environments. Section I contains the controls and indicators for the receiver/exciter and amplifier/coupler units, including

the audible indicators used for determining the operational condition of the radio. Section II contains information for selecting the proper antenna, frequency, mode, and site to achieve best communication at any time and place. Additional information in support of this section is contained in Appendix II which discusses the propagation of radio waves and develops some situational examples for optimizing communication with the radio set.

SECTION I

CONTROLS AND INDICATORS

2-3. GENERAL.

2-4. This section describes the controls and indicators contained on the receiver/exciter and amplifier/coupler units. It also discusses the audible indicators, as heard in the handset, which tell about the operational condition of the radio set.

2-5. CONTROLS AND INDICATORS.

2-6. RECEIVER/EXCITER. The controls, indicators, and connectors of the receiver/exciter (fig 2-1) are listed in table 2-1.

2-7. AMPLIFIER/COUPLER. The controls, indicators and connectors of the amplifier/coupler (fig 2-1) are listed in table 2-2.

2-8. AUDIBLE INDICATORS.

2-9. Five distinctive audio signals in the handset are provided to tell the trained operator much about the operational condition of the radio set. Additionally, the audio signals can be used to effect a bypass mode of operation when the antenna VSWR is less than 1.5:1.

2-10. LOW BATTERY INDICATOR. A repetitive clicking sound indicates that the battery voltage has fallen to less than 20 volts and that the battery is nearly exhausted. The clicking sound will first be

heard during a tune-up or voice transmission, and will stop when the PTT switch is released and the radio reverts to the receive conditions, where the battery drain is a minimum. At this point, the battery retains enough charge to permit about 1 hour of receive operation, with five or six very brief voice transmissions during the hour. When the battery voltage falls low enough that the clicking sound is heard continuously in the receive mode, the battery must be replaced or recharged.

2-11. POWER OUTPUT INDICATOR. If, while transmitting, the operator hears his voice in the handset earpiece, he is hearing what is called sidetone. The presence of sidetone guarantees that the radio set is actually generating an rf signal and that the power output is within 3 db (50%) of the normal limits. The absence of sidetone means the handset or radio set is defective.

2-12. TUNING INDICATOR. If the ANT SEL switch is in the BNC or whip position and the radio has just been turned on, the tuning operation will begin the first time the PTT switch is pressed. A continuous 1-kHz tone will be heard in the handset during the tuning operation. The PTT switch may be released until the tuning operation is complete. When the tone ceases, an increase in receiver noise level (static) indicates that the antenna has been matched and that the radio is now receiving atmospheric noise. If the tone ceases but the receiver noise level does not

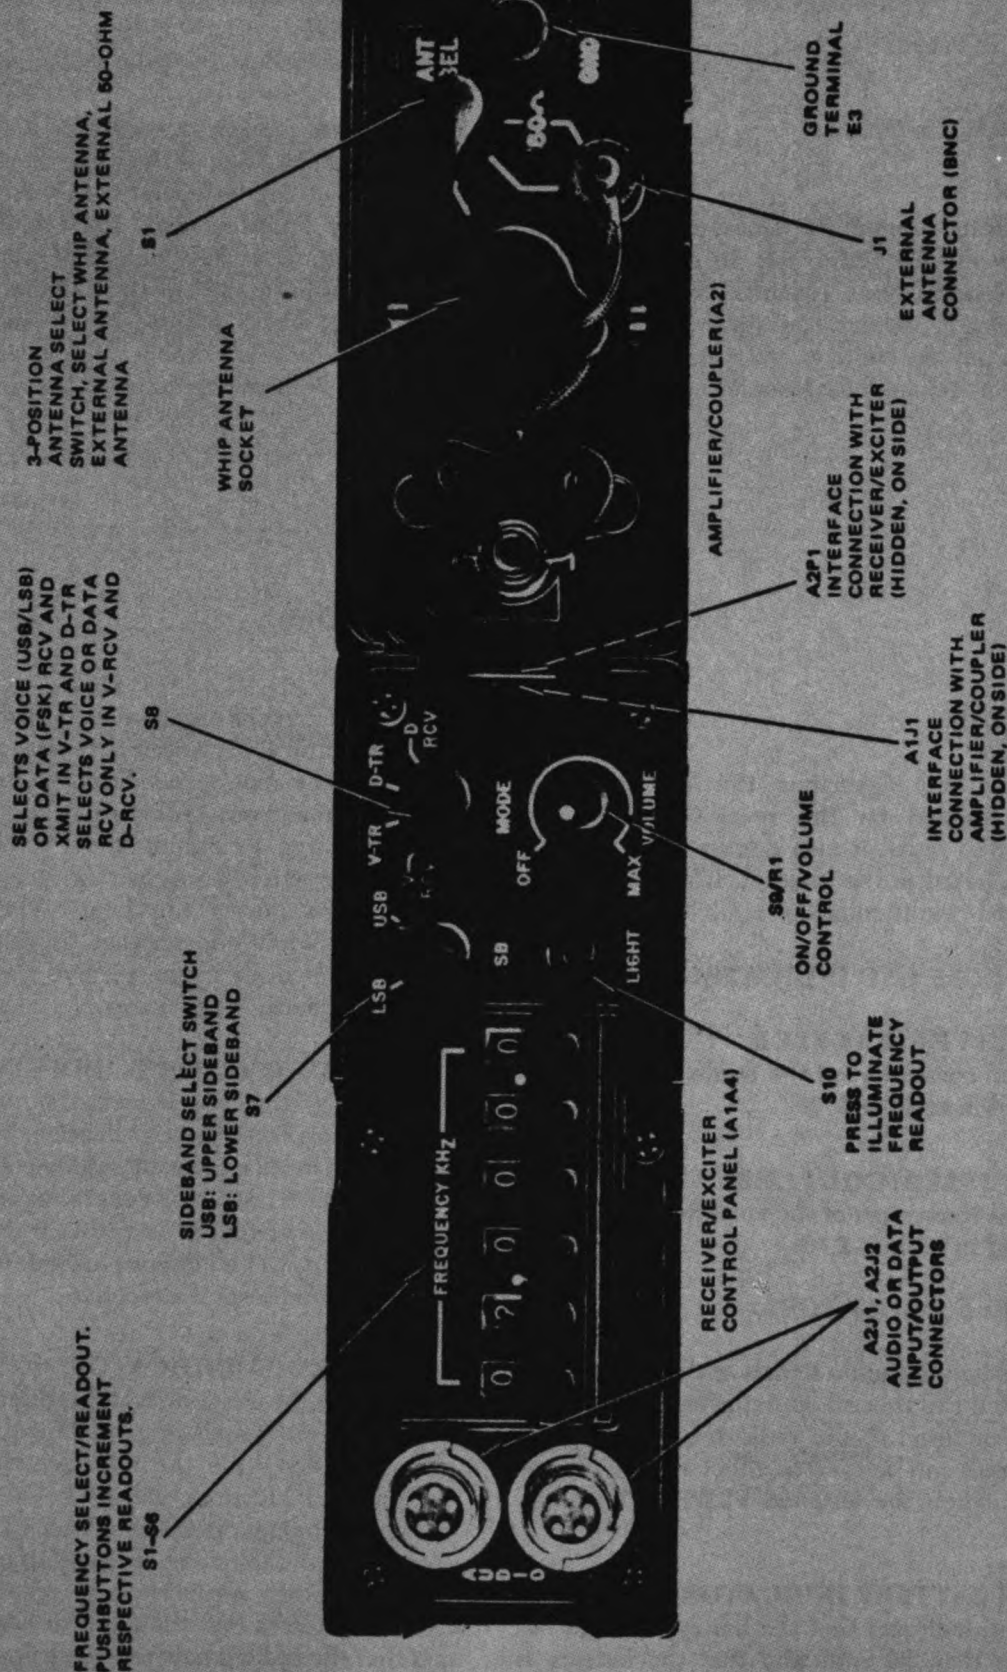

Figure 2-1. AN/PRC-104 Controls and Indicators

TABLE 2-1. RECEIVER/EXCITER CONTROLS AND INDICATORS

NOTE

Prefix reference designators with A1

Control/Indicator	Reference Designator	Function
AUDIO connector	A4A2J1, A4A2J2	Interface connection with input/output devices
FREQUENCY-KHZ switch	A4S1-A4S6	Selects 1 of 280,000 discrete frequencies between 2- and 29.9999-MHz
SB switch	A4S7	Selects either USB (upper sideband) or LSB (lower sideband) operation
MODE switch	A4S8	Selects four modes of operation: V-RCV — Voice and cw receive only V-TR — Voice and cw transmit and receive D-TR — Data transmit and receive D-RCV — Data receive only
VOLUME OFF/MAX switch control	A4S9/R1	Turns power on or off and adjusts the audio level; OFF removes power; MAX indicates maximum audio level
LIGHT switch	A4S10	Illuminates FREQUENCY-KHZ readouts (with red light) when pressed
Connector	J1	Interface connection with amplifier/coupler

increase, the antenna is open, shorted or otherwise faulty.

2-13. NO-TUNE INDICATOR. If the tuning tone continues for a very long time (8 thru 12 seconds) and a beeping sound is heard after the tuning tone stops the tuner has failed to tune and a tune-fault has occurred. (The beeping tune-fault tone will also be heard if the operator selects a frequency below 2 MHz). Turn the radio off and then back on and momentarily press the PTT switch to start a second attempt at tuning. If a second tune fault occurs, the antenna is open or shorted or possibly not suitable for the frequency in use. If all connections to the antenna are tight, no shorts are evident, and the antenna is

free of obstructions, adjust the antenna length, clear the tune fault and attempt a retune. If all efforts to tune fail, the antenna tuner is defective. If a spare amplifier/coupler assembly is not available and communication is essential, refer to paragraph 2-15 on use of the bypass mode.

2-14. VSWR INDICATOR. If the antenna or its immediate environment is disturbed during a transmission, its impedance will change and a high vswr (unmatched) condition will occur. The antenna tuner will measure the vswr at the beginning of the next transmission and will retune if the impedance change is permanent. A short beep at the beginning of a transmission indicates a previous momentary high

vswr condition but no permanent change and no retune. A permanent change in antenna impedance will cause a retune when the PTT switch is pressed.

2-15. BYPASS MODE. The antenna tuner is extremely efficient but some losses are inevitable. The bypass mode (ANT SEL switch set to 50 Ω position and antenna connected to the BNC connector) can be used to provide 10 to 20 percent more rf power to the antenna when the antenna VSWR is less than 1.5:1 (33 thru 75 ohms). The bypass mode can be very useful if

the antenna in use cannot be matched by the antenna tuner, or if the tuner module is faulty. When operating in the bypass mode, the presence of sidetone provides assurance that rf is being generated and made available to the antenna. If a short beep is heard at the beginning of each transmission, the antenna vswr is worse than 4:1, but may still provide useful communications. If the antenna length, or height above ground, or coax feed line can be adjusted to reduce the antenna vswr, the beep will cease, and communications will be very nearly optimum for that particular set of conditions.

TABLE 2-2. AMPLIFIER/COUPLER CONTROLS AND INDICATORS

NOTE

Prefix reference designators with A2

Control/Indicator	Reference Designator	Function
Socket connector	P1	Interface connection with receiver/exciter
Antenna socket	...	Screw-in connection for shock mount of whip antenna
ANT SEL switch	S1	Selects whip socket either through antenna tuner, or BNC connector through antenna tuner, or BNC connector with antenna tuner bypassed (50 Ω impedance antennas only)
BNC connector	J1	Provides BNC connection to compatible antennas other than the whip
GND terminal	E3	Ground point for counterpoise or earth ground

SECTION II

OPERATING CONSIDERATIONS

2-16. GENERAL.

2-17. This section provides information to assist the operator in selecting the proper antenna, frequency, mode, and site for achieving best communication with this radio set. Refer to Appendix II for information on propagation of radio waves and some situational examples for optimizing radio communication.

2-18. OPTIMIZING COMMUNICATION WITH THE AN/PRC-104.

2-19. The reliability and effectiveness of radio communications in the high frequency (HF) range is dependent on several factors:

1. Type of antenna used
2. Operating frequency selected
3. Terrain around transmitting site
4. Time of day
5. Geographic location and distance between stations
6. Atmospheric conditions
7. The effects of the ionosphere on radio waves

2-20. The radio operator can control, to some degree, only the first four or five of these factors. The others affect propagation characteristics and background interference, and are beyond operator control. The antenna and frequency are the most important factors under operator control, and should be selected to best suit the propagation characteristics and distance of the link. Several frequencies will probably have been assigned from upper echelon. They will have been selected in various portions of the band in order to allow a frequency change when propagation conditions change.

2-21. ANTENNA SELECTION (Figure 2-2).

2-22. The field environment, tactical situation, and range required determine the antenna selection. If the radio set is to be used while on the move (manpack operation), the whip antenna supplied with the antenna is used. For most short range requirements using ground wave, the whip antenna will be satisfactory up to 10 miles over land. However, over sea water, this antenna will provide reliable communications up to 100 miles.

2-23. If the tactical situation permits, a simple half-wave dipole or the Near Vertical Incidence Skywave (NVIS) twin dipole antenna can be used between 2 and 12 MHz to extend the range of the radio considerably by utilizing the "skip" phenomenon. In this mode the radio waves are bounced off the ionosphere and back to the earth's surface providing coverage to 300 miles or more. The twin dipole may be used at frequencies above 12 MHz, but automatic tuning may not work at all frequencies. The nature of the dipole or NVIS antenna optimizes the skip effect but final results depend on existing propagation characteristics.

2-24. When using an antenna that has directional characteristics, try to orient the antenna so it is most sensitive in the direction toward the other station. For example, a dipole antenna is most effective in a direction perpendicular to the wire. The NVIS antenna is omni-directional (same sensitivity in all directions), so orientation of the antenna is not important.

2-25. A list of standard and alternate antennas that can be used with the AN/PRC-104, with the major characteristics of each, is shown below:

WHIP ANTENNA	Omnidirectional (360 degree radiation pattern)
	Easily and quickly assembled and erected
	Excellent portability
	Very poor gain; limited range (<10 mi) over land, even in hill terrain. Range may be better under good propagation conditions.
NEAR VERTICAL INCIDENCE SKYWAVE (NVIS)	Omnidirectional
	Requires fairly large clear area (60 feet square) for proper erection
	Good gain; extended range (0 to 300 miles)
HALF-WAVE DIPOLE	Bidirectional (perpendicular to wire)
	Good portability

Figure 2-2. Antennas for Use With the Radio Set

Quickly assembled and erected;
requires two vertical supports
(trees, etc.)

Good gain; extended range (0 to
300 miles and beyond)

QUARTER-WAVE SLANT WIRE

Basically bidirectional

Good portability

Quickly assembled and erected;
requires only one vertical support

Fair gain; moderately extended
range (to 1000 miles)

2-26. FREQUENCY SELECTION.

2-27. The primary considerations when selecting an operating frequency are the distance between the sending and receiving stations, and the time of day. Refer to Appendix II, figures A2-4 and A2-5 which relate the relative effectiveness of communications for four sub-band segments to the time of day. These figures are based on average propagation characteristics for the sub-bands and are intended for use only as a general guide. For detailed frequency planning over a specific time period, propagation prediction charts are available from several government agencies. ("Intermediate and Short Distance Sky-Wave Propagation Charts", Headquarters U.S. Army Communications - Electronics Engineering Installation Agency, Ft. Huachuca, Arizona 85613)

2-28. Another consideration when selecting an operating frequency is the atmospheric condition. If rain or other precipitation is present, signals at the lower end of the hf band may be degraded by atmospheric noise while the higher frequencies will be affected to a lesser degree. Therefore, higher frequencies will provide more effective communications in inclement weather.

2-29. The most useful phenomenon in radio wave propagation is the "skip" effect. This effect occurs because the layers of the ionosphere become ionized by the ultraviolet radiation of the sun. This level of ionization determines the highest frequency for skip over a given distance. Generally, the higher the ionization level, the higher the frequency that can be used in "skip" mode and therefore the broader the range of frequencies available for use.

2-30 SITE SELECTION.

2-31. Site selection is particularly important for short-range, ground wave communications. The existing tactical situation will determine how much of a selection is available. Generally, the best communications will be obtained if the transmitting site is clear of all obstructions, located in an area with good ground conductivity (wet or plowed ground) and as high above ground as possible. Several locations in the same general vicinity should be checked as possible sites. A slight change in antenna location can make a substantial difference in effectiveness.

2-32. Avoid areas near sources of electrical interference such as power lines, radar sets, field hospitals with X-ray machines, etc. Also avoid large structures having metallic content - bridges, tanks, steel reinforced buildings, etc. If enemy jamming is a possibility, the site should be selected so that a large object or terrain feature is situated between the radio and the jamming source. This minimizes the effects of the jamming station and makes it more difficult to locate your transmitter using direction-finding equipment.

2-33. MODES OF OPERATION.

2-34. The radio set mode of operation is dependent upon tactical requirements. The following conditions are examples of the types of conditions which may be encountered.

2-35. NORMAL COMMUNICATIONS. For two-way communications under normal circumstances, the radio set should be operated on V-TR. This selection permits the radio to transmit and receive voice (or cw) communications on any of the 280,000 frequency settings.

2-36. RADIO SILENCE. When field conditions require that no radio transmissions be made, the mode selected should be V-RCV or D-RCV. These modes render the radio set passive and inhibit the modulator in order to prevent inadvertent transmission. When V-RCV is selected, the radio set receives voice (or cw) but cannot transmit. When D-RCV is selected, the radio set receives data information but does not transmit data.

2-37. Data Communication. When field conditions require transmitting and receiving data, the radio set mode selected is D-TR. This mode permits two-way

communication of coded data or teletype (TTY) between field sites.

2-38. Telegraph Communications. When conditions require the use of Morse code communication (cw), the radio set is operated in the V-TR mode for two-way communication. In this mode, the telegrapher's key must be utilized in conjunction with a handset or

headset for reception.

2-39. Data Transceive. When data communication is desired, the output of a data coding device (such as a modem or TTY converter) may be connected to the audio connector on the receiver/exciter control panel. The radio set is then used to transmit and receive coded data.

CHAPTER 3

THEORY OF OPERATION

3-1. INTRODUCTION.

3-2. This chapter contains the functional theory of operation of the radio set. The information is provided to enable the operators and organizational maintenance personnel to understand the overall function and capabilities of the radio set. Section I

contains the overall functional description of the radio set for transmit and receive operation, followed by a brief description of each module. It supports the operator's and organizational level of maintenance for unit replacement. Section II contains a functional block description of each of the seven radio set modules to provide a more detailed level of understanding of the radio set operation.

SECTION I

OVERALL FUNCTIONAL DESCRIPTION

3-3. GENERAL.

3-4. This section describes the overall function of the radio set, and discusses the transmit and receive operation at the module level. It also briefly discusses the function of each module.

3-5. RADIO SET FUNCTIONAL DESCRIPTION.

3-6. The radio set is a 2- thru 30-MHz single sideband (SSB) transceiver with a transmitter output of 20 watts. Operation can be either voice, cw, or coded data (depending on the audio device used) with automatic antenna tuning. There are three levels of frequency conversion between audio and rf in both transmit and receive with two stages of intermediate frequency (if.) amplification and filtering. The radio set consists of seven functional modules. Five of the modules are housed in the receiver/exciter unit:

1. Control Panel
2. Synthesizer
3. Modulator/Demodulator
4. Harmonic Filter
5. Power Supply

3-7. Two functional modules are housed in the amplifier/coupler unit:

1. Power amplifier
2. Antenna tuner

3-8. TRANSMIT OPERATION (Figure 3-1). Input audio signals are routed through the control panel to the modulator/demodulator. The Xmt Audio mixes with the three LO signals sent from the synthesizer to produce a single sideband Xmt RF output. The low power Xmt RF is amplified in the power amplifier and routed through the harmonic filter to remove transmitter harmonics. The filtered Xmt RF is then applied to the antenna, via the antenna tuner for impedance matching.

3-9. RECEIVE OPERATION. The Rcv RF signal from the antenna is routed back through the antenna tuner and is filtered by the harmonic filters to remove spurious signals. The Rcv RF is then routed to the modulator/demodulator where it mixes with the three LO signals sent from the synthesizer to produce the Rcv Audio output. The Rcv Audio is then routed through the control panel to the handset.

3-10. CONTROL PANEL (Figure 3-2). The receiver/exciter control panel provides operational control of the radio set. It couples voice or CW key from the audio devices in use by the operator, and has controls for selection of frequency, volume, mode, and sideband (SB), and illumination of frequency readouts. Frequency Select and Sideband Select signals are routed to the synthesizer, and the Frequency Select signal also to the antenna tuner. Filter Select signals are routed to the harmonic filter. Volume control, mode select and Xmt Audio are applied to, and Rcv Audio is received from, the modulator/demodulator. The control panel also

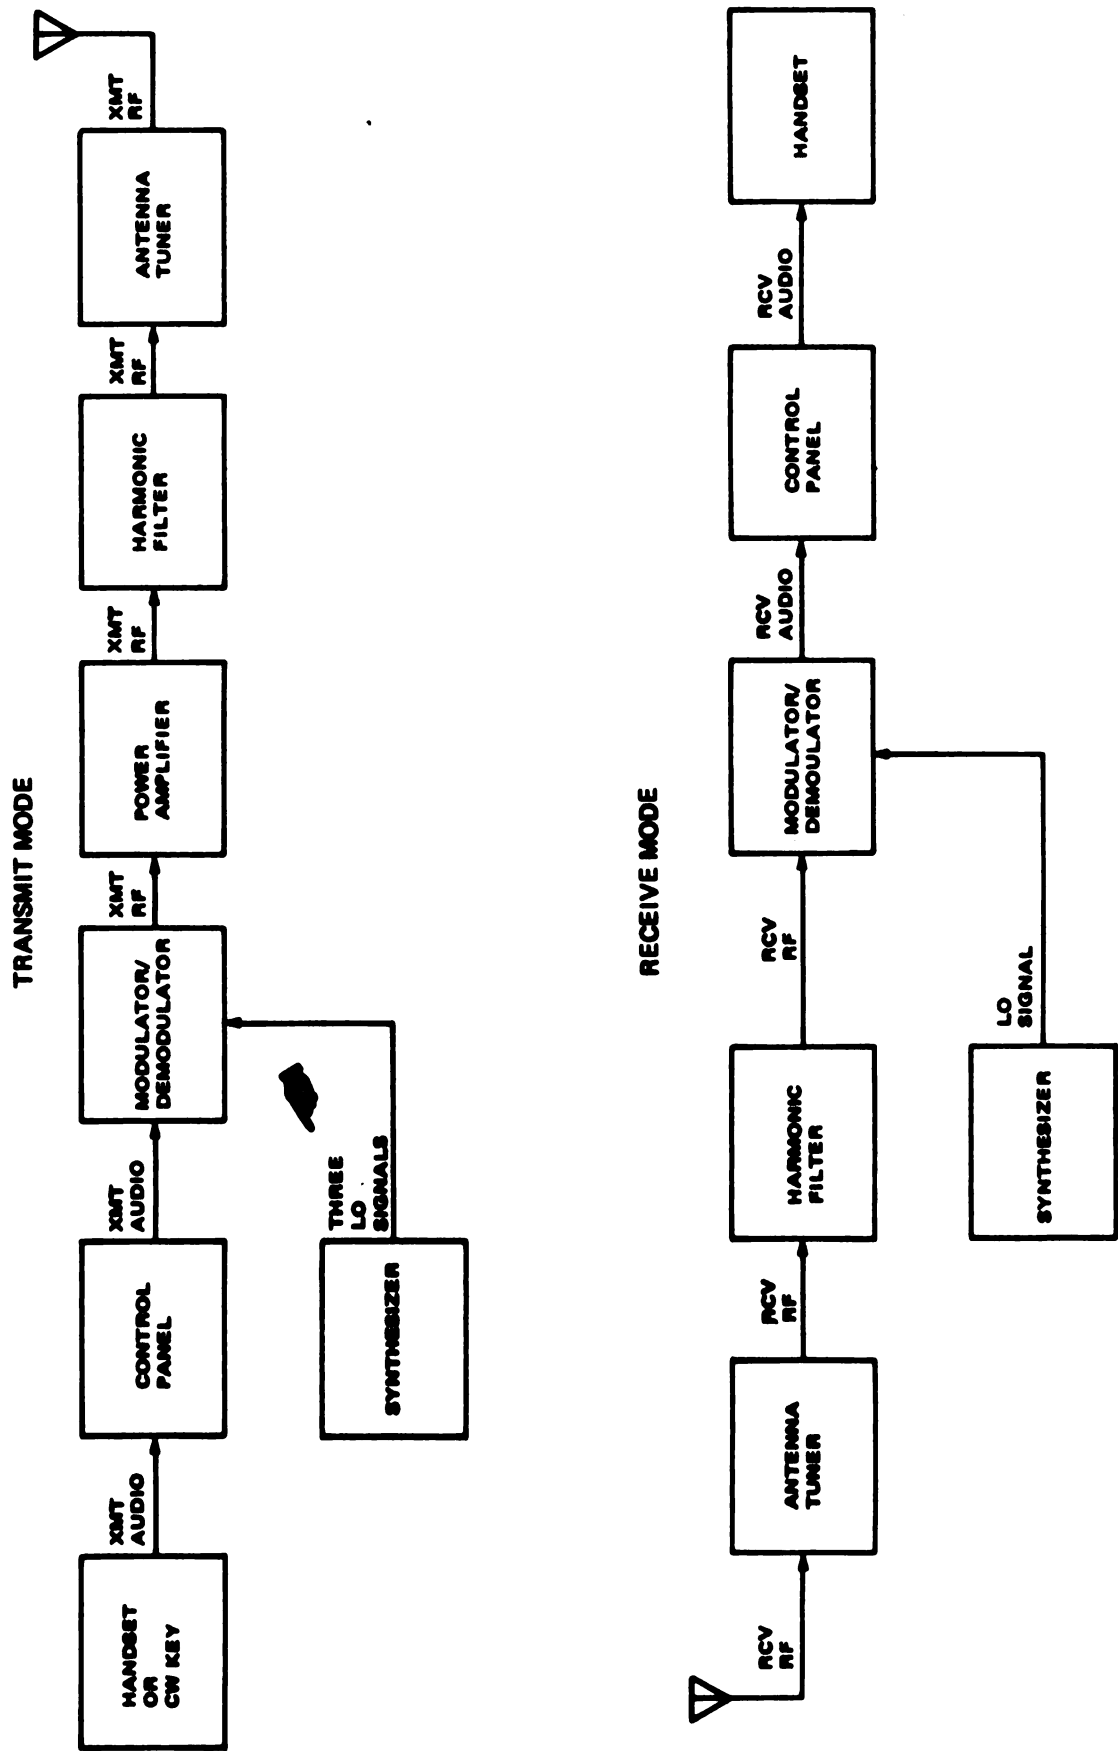

Figure 3-1. Radio Set System Block Diagram

switches on +28v battery power (+28v On), via the volume control, for use by various modules.

3-11. SYNTHESIZER. The synthesizer generates 5 MHz, 70 or 80 MHz, and 77 thru 105 MHz LO signals. These LOs are used by the modulator/demodulator to produce the radio frequency in Xmt, or demodulate rf in Rcv. If the operator selects LSB, 80 MHz is routed to the modulator/demodulator. If USB is selected, 70 MHz is chosen. Frequency Select signals from the control panel determine the frequency between 77 and 105 MHz which goes to the modulator/demodulator. A 1-kHz signal is routed to the modulator/demodulator for use in fault indication signals and cw operation.

3-12. MODULATOR/DEMODULATOR. The modulator/demodulator converts the voice or cw (Xmt Audio) to two intermediate frequencies (if.) and the radio frequency (Xmt RF). It uses the 5 MHz, 70 or 80 MHz and 77 thru 105 MHz LO signals from the synthesizer for this purpose. In receive operation, the same circuits extract the voice or cw (Rcv Audio) from the receive radio frequency (Rcv RF). In addition, the modulator/demodulator contains alarm generator circuits which produce audio signals to alert the operator as follows.

1. Battery power is low.
2. A tune fault condition exists.
3. An antenna tune cycle is in progress.

3-13. POWER AMPLIFIER. During transmit operation, the power amplifier boosts the Xmt RF from the modulator/demodulator to 20 watts. In receive operation, the amplification circuits are bypassed. In Xmt, rf is then routed to the harmonic filter.

3-14. HARMONIC FILTER. The harmonic filter removes undesirable spurious signals during Rcv and transmitter harmonics during Xmt. The specific filter frequency range is determined by the Frequency Select signal from the control panel. The Xmt/Rcv RF path to the antenna tuner is the same for both.

3-15. ANTENNA TUNER. The antenna tuner automatically matches antenna impedance to the radio set at the selected frequency.

3-16. POWER SUPPLY. +28v On from the control panel is routed to the power supply. It produces and distributes regulated +6.5v and +12.5v to the other modules.

BATTERY PACK (OR EXTERNAL POWER SOURCE)

+28V NOMINAL (32-20V)

Figure 3-2. Radio Set Simplified Block Diagram

SECTION II

FUNCTIONAL BLOCK DESCRIPTION

3-17. GENERAL.

3-18. This section contains a functional block description of the seven modules within the radio set.

NOTE

Although the modules are not replaceable at organizational maintenance level, this description is provided to help better understand the operation of the radio set.

3-19. CONTROL PANEL (Figure 3-3). The control panel is a removable module which contains all of the operational controls, and the audio interface connectors and filters for the radio set. The operational controls and audio filtering are discussed below.

3-20. Frequency Selection. Selection of the operating frequency is accomplished by setting the six FREQUENCY-KHZ pushbutton switches to the desired frequency (2.0000 thru 29.9999 MHz). The resultant binary-coded decimal (BCD) Frequency Select and Filter Select signals are used to establish frequency control of the radio set. Frequency selection is performed in 10-MHz, 1-MHz, 100-kHz, 10-kHz, 1-kHz and 100-Hz increments.

3-21. Operational Mode. The MODE switch selects one of the following four modes of operation:

- V-RCV — Voice and cw receive only
- V-TR — Voice and cw key transmit/receive
- D-TR — Data transmit/receive
- D-RCV — Data receive only

3-22. The Mode Select signals from the MODE switch are routed to the modulator/demodulator to activate solid state switches which place the radio set in the selected operating mode. In V-RCV mode, the radio set operates as a receiver only with the modulator (transmit) inhibited. In the V-TR mode, either transmit or receive operations are possible using voice or cw signals. Pushing the PTT on the handset or pressing the cw telegrapher's key sends a Xmt Enable to the modulator/demodulator, which

puts the radio in transmit mode. The same features (receive only, transmit/receive) are available for data D-TR and D-RCV communication, except that the signal bypasses the volume control, the output level becomes fixed, and the input impedance is increased to match standard data systems.

3-23. Sideband Selection. Either low or upper sideband operation can be selected by placing the SB switch in LSB or USB, respectively. The resultant Sideband Select signal from the SB switch causes the synthesizer to route either 70 MHz (USB) or 80 MHz (LSB) to the modulator/demodulator.

3-24. Volume Control. The VOLUME OFF/MAX control is a conventional on-off switch and potentiometer combination. The on-off switch connects +28v On to the modules in the radio set. The potentiometer controls the level of audio signals input to the audio amplifier in the modulator/demodulator.

3-25. Panel Illumination. The LIGHT switch, when pressed, illuminates the FREQUENCY-KHZ readouts on the control panel with red light.

3-26. Audio Filtering. The Audio to or from the audio devices is filtered both in receive and transmit modes. This prevents Xmt RF from being picked up by the cables leading to the audio devices and being sent back into the radio set.

3-27. POWER SUPPLY (Figure 3-4). The power supply converts +28v On from the control panel to +12.5 and +6.5v. This is done by two down switchers (transistorized regulating circuits). An overload latch shuts the down switchers off if an excessive load (a short circuit, for example) is present at the output. The +6.5v goes to the antenna tuner, power amplifier, modulator/demodulator, and synthesizer. The +12.5v goes to the control panel, synthesizer, and modulator/demodulator. These voltages are regulated.

3-28. SYNTHESIZER (Figure 3-5). The synthesizer generates three sinusoidal LO signals which are used by the modulator/demodulator. All of the frequencies generated by the synthesizer are referenced to a temperature-compensated crystal oscillator (TCXO), which is the frequency standard for the radio set. Because the TCXO is temperature-compensated over a -46 to +71 °C range, the Xmt RF frequency will not

Figure 3-3. Control Panel Pictorial Block Diagram

Figure 3-4. Power Supply Block Diagram

shift noticeably with temperature. The TCXO outputs 5 MHz LO which is applied directly to the modulator/demodulator. The same 5 MHz LO goes to a frequency divider where it is divided to 10 kHz and 1 kHz. The 1 kHz frequency is used by the modulator/demodulator for cw key operation or for fault indication signals.

3-29. The 5 MHz LO is also applied to a frequency multiplier which generates 70- and 80-MHz harmonics. The harmonics are filtered by 70- and 80-MHz bandpass filters and routed to the limiter. The Sideband Select signal is applied to the limiter. If the sideband select switch is set to LSB, then the limiter sends 80 MHz LO to the modulator/demodulator. If USB is selected, the limiter sends 70 MHz LO to the modulator/demodulator.

3-30. The Frequency Select from the control panel determines the output of the 77-105 MHz LO signal using a dual phase-locked loop. A dual loop is faster than a single loop phase locking system. A voltage (2.64 thru 9v) from the phase-locked loop tunes the voltage-controlled oscillator (VCO) to a higher or lower frequency. The 77-105 MHz LO signal is divided in the dual phase-locked loop according to the Frequency Select setting until it is 10 kHz. It is compared against the 10 kHz from the frequency divider to provide the locking action. If the divided 77-105 MHz LO is above or below 10 kHz, the VCO's output is automatically adjusted.

3-31. MODULATOR/DEMODULATOR (Figure 3-6). The modulator/demodulator performs frequency conversion for both transmit and receive operation. The audio control hybrid contains control circuits, while the three converters perform the frequency conversion. The hybrid outputs the Xmt/Rcv Control signal which determines whether the radio set is in transmit or receive operation.

3-32. The hybrid accepts signals from other modules in the radio set and generates the following alarm signals: (1) Low Battery Indicator, (2) Tune In Progress, and (3) Tune Fault. The Low Battery Indicator is set off if the +28v On from the control panel drops below +20v. The Tune In Progress indicates that the antenna tuner is automatically matching the antenna to the radio set at the selected frequency. The Tune Fault indicates that the antenna tuner cannot match the impedance of the antenna and radio set at the selected frequency. The Alarm signal is routed from the alarm circuits to the audio circuits to develop audible tones which are applied to the Rcv Audio:

1. When battery power drops below +20v, a clicking sound is heard in the handset.
2. If the antenna fails to complete a tune cycle within 12 seconds, a repetitive beeping 1-kHz tone will be heard in the handset (Tune Fault). The tone will also be heard if a frequency below 2 MHz is selected.
3. During the time that the antenna tuner is in a tune cycle, a steady, low-volume (1-kHz) tone is heard in the handset (Tune In Progress).

3-33. The audio circuits control the level of the transmit signal and the gain of the receive signal. The mode signal from the control panel inhibits transmit operation if V-RCV is selected. The 1 kHz from the synthesizer is switched on and off by the cw key. In transmit operation, the Xmt Audio frequency is routed from the audio control hybrid to the third converter, where it is mixed with 5 MHz LO. The sideband filter passes the lower sideband if. product of the third converter (5 MHz - Xmt Audio) and routes it to the second converter. At the second converter, it mixes with either 70 or 80 MHz, depending on the sideband selection (80 MHz for LSB, 70 MHz for USB). The bandpass filter passes 75-MHz frequencies

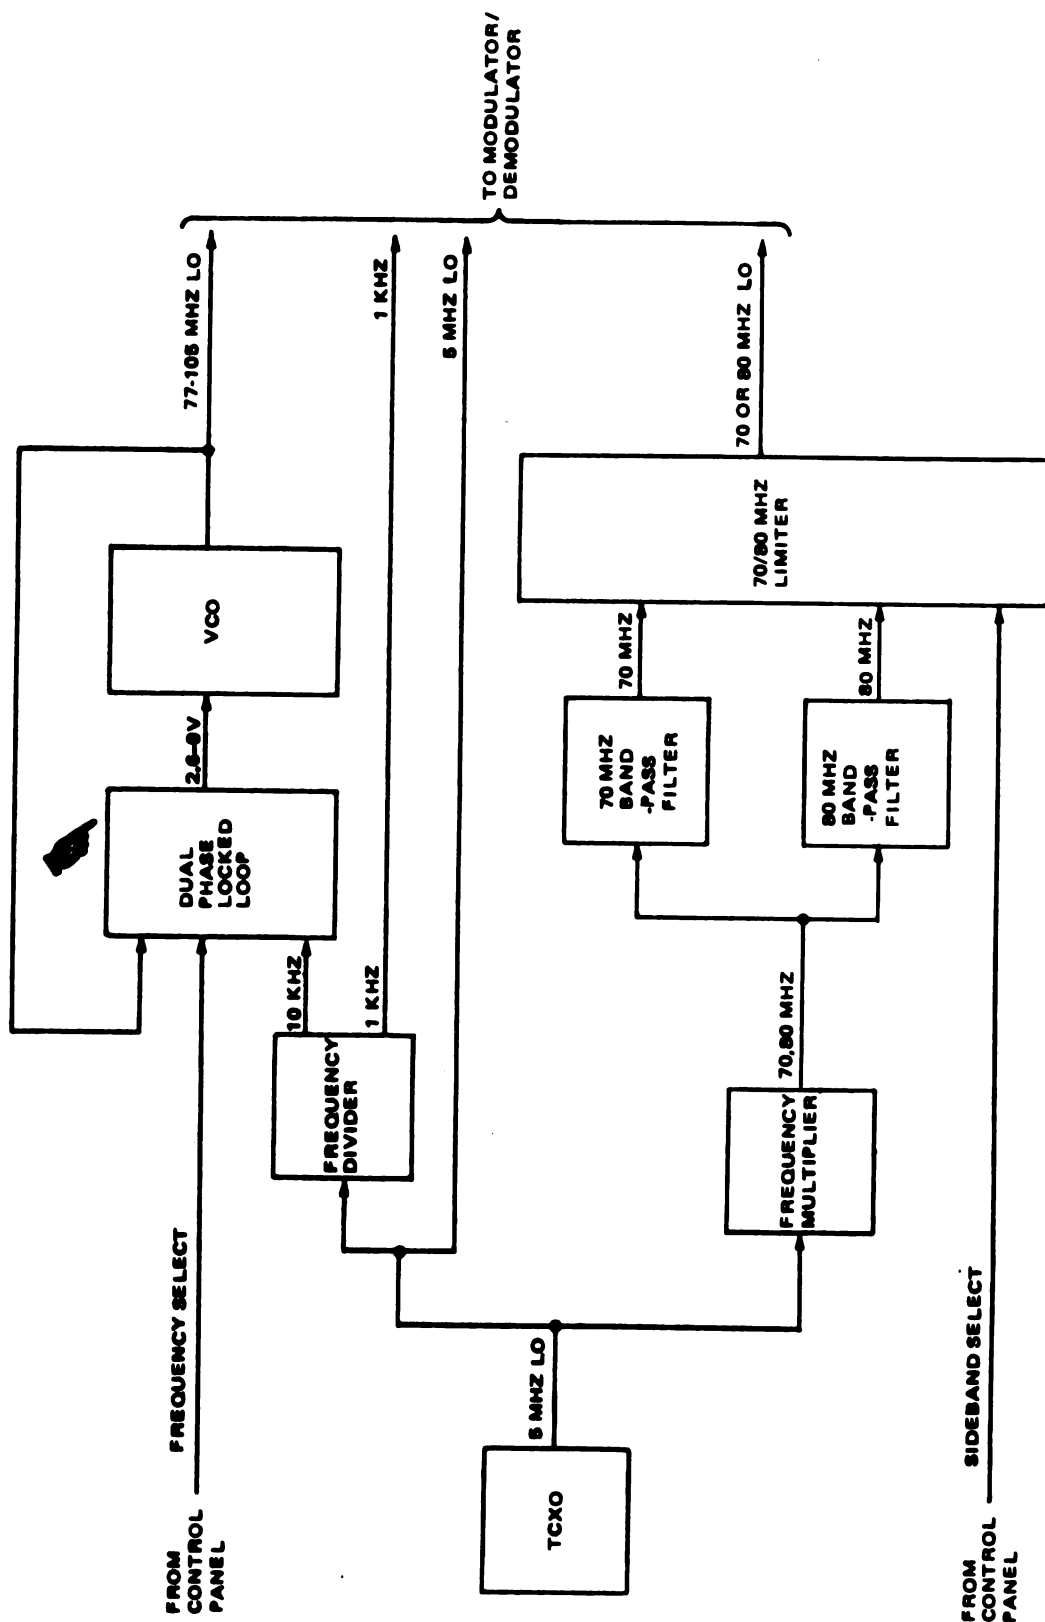

Figure 3-5. Synthesizer Block Diagram

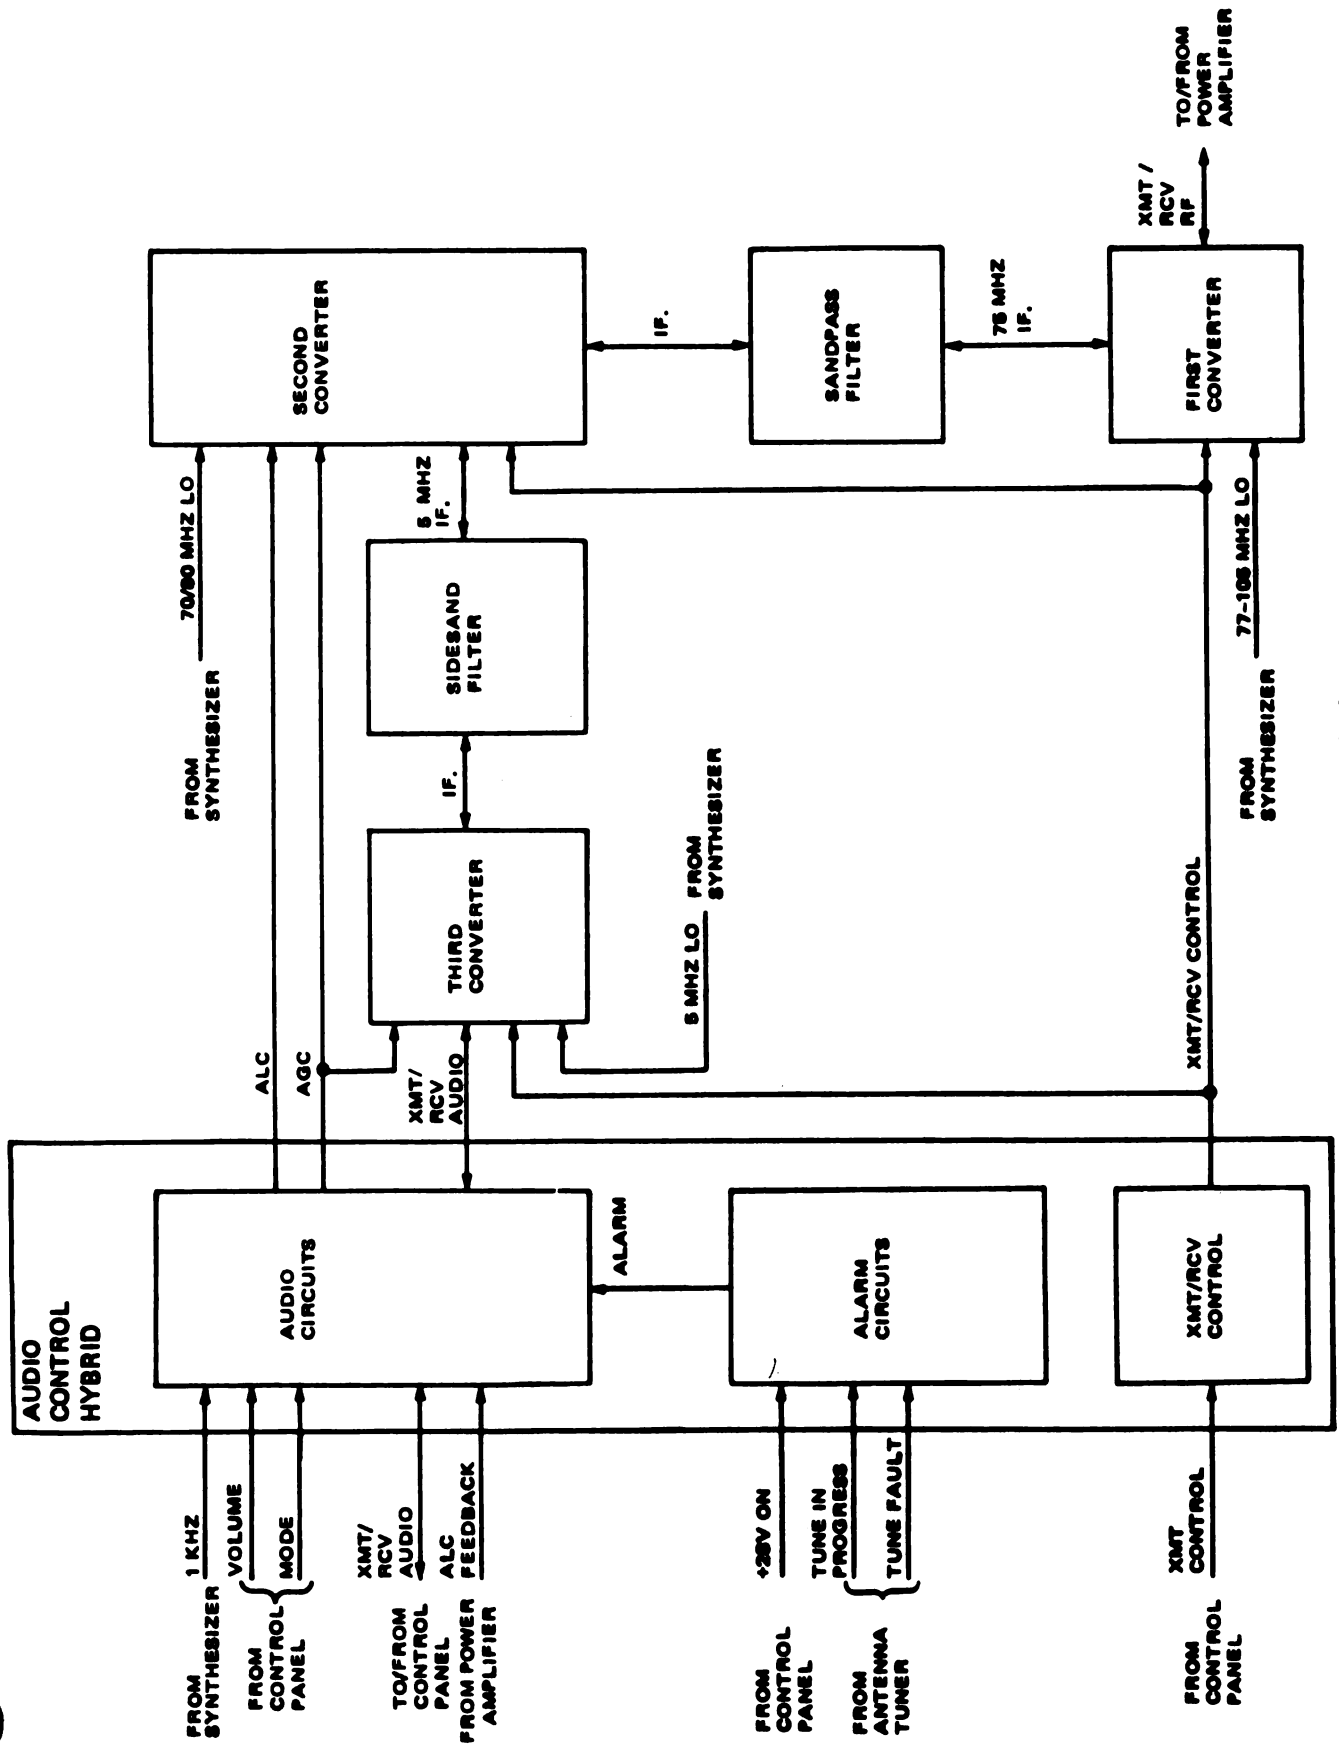

Figure 3-6. Modulator/Demodulator Block Diagram

from the second converter. With USB selected, the upper if. product is passed $[70 \text{ MHz} + (5 \text{ MHz} - \text{Xmt Audio})]$; with LSB, the lower if. product is passed $[80 \text{ MHz} - (5 \text{ MHz} - \text{Xmt Audio})]$. The first converter then mixes the bandpass filter if. with a specific frequency between 77 and 105 MHz ($75 \text{ MHz} + \text{Xmt RF frequency}$). The specific mixing frequency is determined at the control panel, made in the synthesizer, and precalculated to produce the desired Xmt RF. For example, with 5 MHz and USB selected at the control panel, the LO is 80 MHz, and the Xmt RF is $[80 \text{ MHz} - (70 \text{ MHz} + 5 \text{ MHz} - \text{Xmt Audio})]$ or $5 \text{ MHz} + \text{Xmt Audio}$.

3-34. In receive operation, the flow direction is reversed. The same circuits are used, except that certain amplifiers are switched into and out of the system. The Rcv RF mixes with the 77-105 MHz LO in the first converter to create upper and lower if. products. The upper if. product is filtered out at filter FL1. The lower product (75 MHz, if.) is passed to the second converter where it mixes with either 70 (USB) or 80 MHz (LSB). The 5-MHz if. product is passed through filter FL2 while the upper if. product is filtered out. The 5-MHz if. is mixed with 5 MHz in the third converter to create the Rcv Audio. The level of the receive signal is controlled at the second and third

converters by the hybrid audio circuits via the agc (automatic gain control) signal.

3-35. POWER AMPLIFIER (Figure 3-7). The power amplifier boosts the 0.30-watt output from the modulator/demodulator to provide 20-watt (nominal) rf power at the antenna. The Xmt RF is preamplified to 2 watts in the driver stage. It is then amplified to about 27 watts in the output stage. (About 7 watts is lost in the filter and antenna tuner.) The DC-DC converter provides the +30.5v Regulated voltage for the output stage. The tuner dc source generates +16v Regulated for use by the antenna tuner during impedance matching. This is triggered by the Tune In Progress signal from the antenna tuner. The tuner dc source compensates for changes in battery voltage and temperature. The power monitor circuits use the vswr signal from the harmonic filter to protect the power amplifier. If the antenna is badly matched to the radio set, power reflects back at the power amplifier. This could cause damage. When a poor match occurs, the power monitor disables the driver stage (PA disable), enables the antenna tuner to begin tuning (Tune Check Enable), and sends ALC Feedback signal to the modulator/demodulator. The ALC controls the rf power output level of the receiver/exciter in transmit operation.

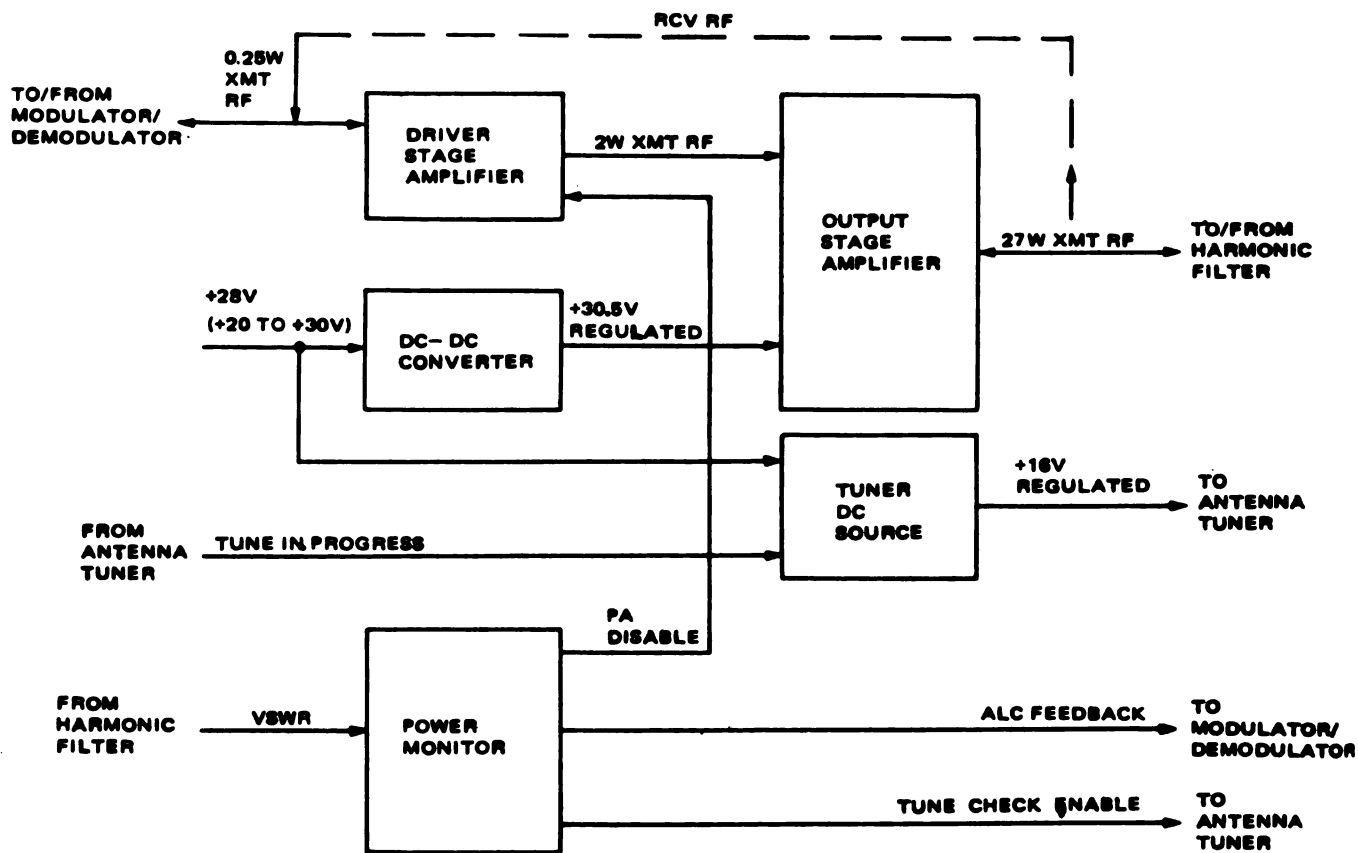

Figure 3-7. Power Amplifier Block Diagram

3-36. HARMONIC FILTER (Figure 3-8). The harmonic filter suppresses transmitter harmonics and noise levels outside of the selected frequency band. To do this, the Xmt/Rcv must pass through the bandpass filter. The Filter Select signal from the control panel energizes one of the six filter select relays which switches the associated filter into the circuit. The filters are passive and are used in both transmit and receive modes. The rf detector circuits monitor the amount of power going to and returning from the antenna (vswr). This signal is applied to the power amplifier.

Figure 3-8. Harmonic Filter Block Diagram

Figure 3-9. Antenna Tuner Block Diagram

3-38. When a tune start is generated, the L-C control resets the L-C network to zero. This means that there will be no inductors or capacitors in the Xmt/Rcv RF pathway. When the operator transmits, the rf sensor bridge samples the Xmt RF and produces a Vswr signal. In addition, a Tune In Progress signal is sent to the modulator/demodulator. The L-C control uses the Vswr and the Frequency Select signals to adjust the L-C network to its correct value via the L-C select signals. If a Tune Check Enable is routed from the

3-37. ANTENNA TUNER (Figure 3-9). The antenna tuner automatically transforms the antenna impedance (reactive/resistive) to 50 ohms. This is done by using an adjustable L-C network. The antenna tuner is normally off, and the L-C network is held in place by magnetic latching relays. The antenna tuner becomes operational whenever: (1) the radio is turned on, (2) the MODE switch is changed from V-RCV to V-TR or D-RCV to D-TR, or (3) the frequency is changed. This causes a tune start signal to be applied to the L-C control from the control panel.

power amplifier during transmission, the antenna tuner will recheck its tune and perform a retune if necessary.

3-39. If the tuning cycle takes too long (over 12 seconds), the L-C control will output a Tune Fault signal. This means that either the selected antenna is not within the tuning range of the antenna tuner, or that the module could be faulty. A Tune Fault signal is sent immediately should a frequency below 2 MHz be selected.

CHAPTER 4

MAINTENANCE INSTRUCTIONS

4-1. INTRODUCTION.

4-2. This chapter contains preventive maintenance, troubleshooting, and repair instructions for the radio set. Preventive maintenance includes periodic checks and services and cleaning. Troubleshooting includes

the radio set performance test and fault isolation using audible tones. Repair includes removal and replacement instructions for the radio set units and accessories. This chapter also includes complete coverage of the battery pack, because all maintenance is performed at operator and organizational levels.

SECTION I

PREVENTIVE MAINTENANCE

4-3. GENERAL.

4-4. Preventive maintenance is the systematic inspection and servicing of the radio set to prevent equipment failure, reduce downtime, and assure that the radio set is serviceable. This section contains daily, weekly, and quarterly checks and services; cleaning instructions and corrosion control instructions.

4-5. PERIODIC CHECKS AND SERVICES

4-6. DAILY CHECKS AND SERVICES. Table 4-1 contains the checks and services to be performed on a daily basis.

4-7. WEEKLY CHECKS AND SERVICES. Table 4-2 contains the checks and services to be performed on a weekly basis.

4-8. QUARTERLY CHECKS AND SERVICES. Quarterly checks and services consist of performing the radio set performance test contained in figure 4-2. For Air Force maintenance perform the audible tone performance test contained in figure 4-1.

4-9. CLEANING.

4-10. Cleaning of the radio set is to be performed when necessary, as follows:

1. Remove dirt, dust, grease, or other debris from external surfaces as follows:
 - a. Remove dust and loose dirt with a cloth or

brush.

- b. Wash surface with a cloth or brush moistened in soapy water.

- c. Rinse with a clean cloth moistened in clear water.

- d. Dry, using a soft lint-free cloth.

2. Remove dust and dirt from connectors and pins with a soft bristle brush.

3. All battery pack maintenance information is contained in section IV.

4-11. CORROSION CONTROL.

4-12. The following maintenance actions are performed when necessary for prevention and control of corrosion and fungus on the radio set.

1. Separate the three units (receiver/exciter, amplifier/coupler, and battery pack) from the radio set and inspect the exterior of each unit for corrosion and fungus (particularly around the controls, connectors, and latches).

2. Remove all corrosion and fungus with a cloth and/or brush moistened in cleaning solvent.

3. Repaint all treated areas immediately upon removal of corrosion to alleviate reoccurrence of corrosion build-up.

TABLE 4-1. DAILY CHECKS AND SERVICES

Check	Item to be Inspected	Procedure
1.	Completeness	Check to see that radio set is complete, and that all hardware is present and properly fastened
2.	Exterior Surfaces	Remove dust, dirt, or other debris
3.	Controls	Check each control for proper mechanical action
4.	Battery	Check battery pack for leakage or corrosion
5.	Operation	Perform initial checkout described in chapter 1

TABLE 4-2. WEEKLY CHECKS AND SERVICES

Check	Item to be Inspected	Procedure
1.	Battery Condition	Remove battery pack cover and check for corrosion or leakage. Clean or replace as required (refer to section IV)
2.	Connectors	Check all connectors for debris, damage, or corrosion. Refer to higher level of maintenance as required
3.	Antenna	Check for breaks or strain. Repair or replace as required

SECTION II

TROUBLESHOOTING

4-13. GENERAL.

4-14. Operator and organizational troubleshooting is limited to isolating a fault to a replaceable unit or accessory. Fault isolation at this level may be accomplished using operational indications and distinct audible tones produced within the radio set. This section covers the use of the audible tones, as heard in the handset, for fault indication and isolation by the operator. It also contains the radio set performance test for complete fault isolation to the faulty unit at the organizational level.

4-15. USE OF AUDIBLE TONES. Audible tones are provided to indicate that the following basic operational conditions exist:

1. Normal Condition. Receiver noise in handset at turn-on, low volume sidetone when transmitting into an antenna or 50 ohm load.

2. Tuning. A brief (1.5- to 12-second) tone (tune-up tone) while the antenna tuner performs a tune cycle.

3. Tune Fault. A beep sound (tune tone) indicating that a tuning fault exists.

4. Battery Low. A clicking sound indicating battery voltage is low.

4-16. PERFORMANCE TEST. Performance tests are provided for the operator's and organizational level. The meaning of the various audible tones available to the radio set operator for fault indication and isolation is described in table 4-3.

4-17. An operator's radio set performance test flowchart using only audible tones, without test equipment, is contained in figure 4-1.

4-18. Organizational level radio set performance test setup and test flowchart are contained in figures 4-2 and 4-3. Air Force organizational maintenance uses the audible tones performance test in figure 4-1.

TABLE 4-3. FAULT INDICATION BY AUDIBLE TONES

Item	Symptom	Probable Cause
1.	No receiver noise at turn-on	a. Dead battery (refer to section IV) b. Receiver/exciter faulty
2.	Clicking sound	Battery low (refer to section IV)
3.	No tune-up tone	a. Amplifier/coupler faulty b. Receiver/exciter faulty
4.	Tune-up tone then tune fault tone	a. Amplifier/coupler faulty b. Antenna connection bad
5.	Tune fault tone at turn-on	Receiver/exciter faulty or frequency selected is lower than 2 MHz
6.	No transmit sidetone	a. Receiver/exciter faulty b. Amplifier/coupler faulty
7.	No receiver audio	a. Volume too low b. Antenna connection bad c. Receiver/exciter faulty d. Amplifier/coupler faulty

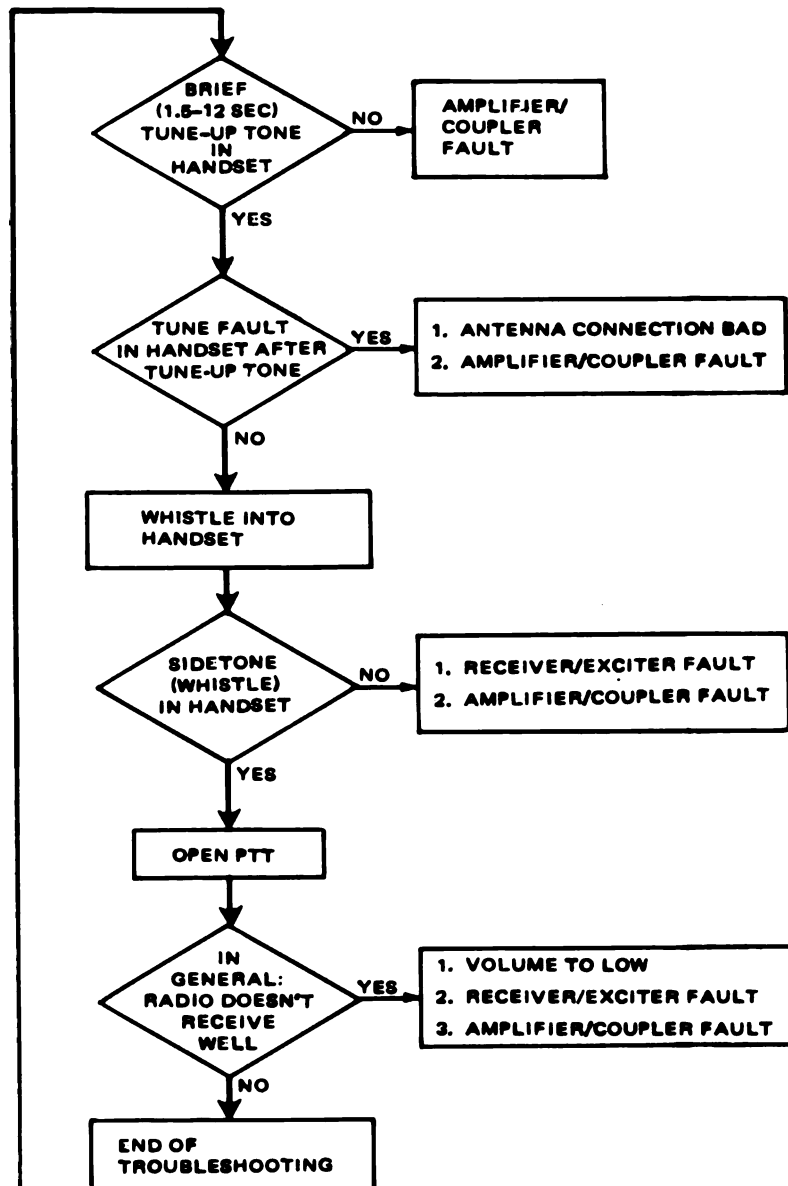

Figure 4-1. Operator's Radio Set Performance Test With Audible Tones

SECTION III

REPAIR

4-19. GENERAL.

4-20. This section covers repair at the operator and organizational maintenance levels, which consists of removing and replacing radio set units and exchanging accessories. Further repair requires higher levels of maintenance.

4-21. REMOVAL. Unit and accessory removal (fig 1-4) is accomplished as follows:

1. Remove the antenna or antenna cable and audio accessories as required.
2. Unfasten the 2 latches securing the battery pack to the receiver/exciter and amplifier/coupler combination and remove the battery pack.
3. Lay the receiver/exciter and amplifier/coupler combination on a flat surface.

4. Unfasten the front latch and then the rear latch securing the receiver/exciter and amplifier/coupler together.

5. Carefully separate the two assemblies to prevent damaging the connector.

4-22. REPLACEMENT. Unit and accessory replacement is accomplished as follows:

1. Secure the receiver/exciter and amplifier/coupler assemblies together and fasten the latches.
2. Secure the battery pack to the receiver/exciter and amplifier/coupler combination and fasten the latches.
3. Reconnect the antenna and audio accessories.

APPENDIX I

LIST OF ABBREVIATIONS

A		L	
AGC	Automatic Gain Control	LO	Local Oscillator
ALC	Automatic Level Control	LSB	Lower Sideband
AM	Amplitude Modulator	LUF	Lowest Usable Frequency
ANT SEL	Antenna Select	M	
B		MHz	One Million Hertz
BCD	Binary Coded Decimal	MUF	Maximum Usable Frequency

		X	
		Xmt (XMT)	Transmit

APPENDIX II

PROPAGATION OF RADIO WAVES

A2-1. GENERAL.

A2-2. This appendix provides information on propagation of radio waves in the high frequency (hf) band used by the radio set. The data and illustrations are based on average propagation characteristics of various hf band segments and indicate relative effectiveness during the day and night. They are to be used only as a general guide. Also discussed are two situational examples for optimizing communications.

A2-3. RADIO WAVES.

A2-4. Radio waves in the 2 thru 30 MHz region of the electromagnetic spectrum are propagated in two ways: the ground wave and the sky wave.

A2-5. GROUND WAVE (Figure A2-1). There are two types of ground waves which exist in various magnitudes depending on the frequency, type of antenna and terrain conditions.

A2-6. Surface Wave. This electromagnetic wave travels directly along the earth's surface and is dependent on the ground conductivity. Because ground conductivity is generally quite poor, unless propagated over water, this wave is rapidly attenuated. This attenuation is particularly pronounced at frequencies greater than 3 MHz making it unreliable for low-power communication networks beyond about 10 miles. Although attenuation is greater as frequency increases, better efficiency of the whip antenna and a drop in atmospheric noise favor the use of higher frequencies for links dependent on surface wave.

A2-7. Direct Wave. This is the "line-of-sight" wave which exists at all frequencies. The range of this wave is limited by the horizon. The direct wave is utilized most frequently for short range communication.

A2-8 SKYWAVE (Figure A2-2). Skywaves (ionospheric waves) are basically direct waves that have been reflected (skipped) back to earth by the ionosphere. The ionosphere exists at altitudes between 30 and 300 miles and consists of several layers of ionized gases. These gases are ionized by several factors, the primary of which is ultraviolet radiation; the greater the level of ionization the more reflective the ionosphere will be. The ultraviolet radiation level is directly proportional to the amount

of sunspot activity and is predictable with a high degree of accuracy. This reflective power of the ionosphere makes it possible to communicate over great distances using hf radio transmissions.

A2-9. MAXIMUM USABLE FREQUENCY. At any given time for a predetermined path length (skip distance) there will exist a Maximum Usable Frequency (MUF). This MUF is the highest frequency radio wave that will be reflected back to earth in a specified geographical region for that path length. The MUF is a predictable number and is available in the form of propagation prediction charts. A sample of a propagation prediction chart is shown in figure A2-3. The MUF is highest at noon or early afternoon and drops to its lowest in the early morning hours. The MUF is lower on short paths and higher on long paths.

A2-10. FREQUENCY OF OPTIMUM TRANSMISSION (FOT). If the MUF is known, the best frequency selection would be one that is sufficiently close to the MUF to be reflected but not so close that it is affected by minor changes in ionospheric density. This is around 85 percent of the MUF. (Example: if MUF is 10 MHz, optimum frequency will be $8.5 \times 10 \text{ MHz}$ or 8.5 MHz.) This frequency is called the Frequency of Optimum Transmission (FOT) and is commonly referred to as the Optimum Traffic Frequency.

A2-11. MULTI-SKIP PHENOMENON. There will be instances when the skywave is reflected between the ionosphere and the earth surface several times. This multi-skip phenomenon occurs quite frequently making global communications possible in the hf band. In addition to multi-skip there also exists a multipath propagation characteristic. If this occurs, two waves that took different paths will reach the receiver simultaneously. Depending on their relative phases, the signal strength will be enhanced or reduced. If the two waves are of equal amplitude and phase shifted 180 degrees, total cancellation will result and the received signal will fade out. Operating near the FOT will minimize multipath degradation.

A2-12. HF BAND SEGMENTS. The following is a breakdown of the hf band and a general description of the behavior of each segment. There will be exceptions but the descriptions will hold true in most cases. Figures A2-4 and A2-5 show relative

Figure A2-1. Ground Wave Propagation

Figure A2-2. Skywave Propagation

effectiveness of different segments depending on the time (less than 100 miles and between 100-500 miles, respectively).

A2-13. 2 thru 5 MHz. This band is useful during daylight hours for intermediate and short-range skywave communications and good for long range (several thousand miles) during the night. The static level is highest during the summer.

A2-14. 5 thru 10 MHz. This band is similar to the 2 thru 5 MHz band except long-range communication is possible during daylight hours under good conditions (high sunspot activity). The signals follow the darkness path best and during winter it is possible to

communicate with stations on the other side of the world. The winter months are better than the summer months because of the high summer static level, especially in equatorial parts of the world.

A2-15. 10 thru 15 MHz. This band is the best choice for reliable intermediate and long-range communication during all propagation conditions. During very low levels of sunspot activity, the band will not be useful at night but improves greatly at dawn and holds up well until dusk.

A2-16. 15 thru 25 MHz. This band is highly variable and quite dependent on sunspot activity. When conditions are good, it will be useful during day and

TYPICAL PROPAGATION PREDICTION CHART

TIME OF DAY (LOCAL)	D1		D2	
	MUF	FOT	MUF	FOT
0001	5.3	4.6	7.0	5.7
0002	4.6	3.8	6.5	4.6
0003	4.7	3.5	6.1	4.7
0004	4.6	3.5	6.1	4.6

Figure A2-3. Relative Skip Distance for Two Different Frequencies

early night, but if sunspot conditions are poor, it may not be usable at all. This band is suitable for short range (less than 10 miles) surface wave communication using a whip antenna.

A2-17. 25 thru 30 MHz. This band is useful as a very short-range communication band (less than 10 miles) and is excellent for long-range (several thousand miles) communications during good propagation conditions. It is generally unusable for intermediate range communication.

A2-18. SITUATIONAL EXAMPLES.

A2-19. The following examples demonstrate several different situations that might occur when attempting to establish a communications link. These examples will help clarify the information on optimizing communication.

A2-20. SITUATION 1.

A2-21. Scenario. You are under enemy fire and cannot move without great risk. It is 1400 hours local time and you are trying to contact your Tactical Operation Center (10 miles south) to request air support. Your available frequencies are 2.138, 5.672, 9.193, 11.272 and 16.385 MHz.

A2-22. Recommendation. The tactical situation only permits the use of the whip antenna. Since the station with whom you want to communicate is only 10 miles south, the whip antenna will be adequate. Considering this to be short range surface wave, the best frequency selection would be a high one, in this case either 16.385 or 11.272 MHz.

A2-23. SITUATION 2.

A2-24. Scenario (Figure A2-6). Your squad must set up an observation post (OP) as part of a road surveillance team. You are required to check in with your headquarters (50 miles east) once every hour. Your OP is in a mountainous region and a large mountain is located between you and your headquarters (see fig A2-6). Your frequency possibilities are the same as in situation 1.

A2-25. Recommendation. Your OP is selected to give you a clear view of the area while camouflaging your position with the mountain as a background. Your radio location is selected to provide a clear path to your headquarters while shielding your transmissions from the enemy to reduce the possibility of being located with radio direction finding equipment. Because you will be maintaining a fixed location for an extended period of time, you may use any antenna you wish. The best choice would be the NVIS antenna. Your headquarters is only 50 miles east, however there is a large mountain blocking direct waves. The NVIS, with a very high angle of radiation, will bounce off the ionosphere and over the mountain. Your transmissions might be copied by the enemy but your shielded location will minimize the chances of being located. As the day progresses, you will want to change frequency in order to optimize communications. The following recommendation should ensure constant communications.

0001 to 0500 (dawn)	2.138 or 5.672 MHz
0500 to 1200	5.672 or 9.913 MHz
1200 to 2000 (dusk)	9.913 or 11.272MHz
2000 to 2400	5.672 or 9.913 MHz

Figure A2-4. Short Range (Less Than 100 Miles) HF Communications Effectiveness

Figure A2-6. Site Selection, Situation 2

APPENDIX III

DIPOLE ANTENNA KIT

A3-1. GENERAL

A3-2. This appendix provides information on the dipole antenna kit and general instructions for setting up various versions possible with this kit.

A3-3. The dipole antenna kit (fig A3-1) consists of two reels of antenna wire with the required BNC plugs, two reels of Dacron cord and weights, and a dipole lead-in fixture. The components of the wire antenna kit can be arranged in any of the following configurations: Slant wire (fig A3-2), two-support dipole (fig A3-3), sloping dipole (fig A3-4), or inverted-V dipole (fig A3-5). Figure A3-6 details the attachment of the antenna wires to the dipole fixture.

A3-4. SLANT WIRE ANTENNA. A slant wire antenna is much more effective than the whip antenna. The slant wire antenna requires the use of a dipole antenna (fig A3-1) and an antenna support. It is used when greater range is necessary than the whip antenna can provide, and when time or conditions do not allow the erection of a full horizontal dipole. The proper arrangement for a slant wire antenna is shown in figure A3-2. Erect a slant wire antenna as follows:

1. Decide on the direction that transmission is required and determine the alignment of the antenna (fig A3-7).

2. Unwind one of the dipole antenna reels to the length specified in the antenna length table A3-1. The equations for calculating dipole antenna lengths are:

Each leg in feet

$$= \frac{234}{\text{Frequency in MHz}}$$

Full length of dipole antenna in feet

$$= \frac{468}{\text{Frequency in MHz}}$$

3. Loosen the antenna wire through the notch on the reel to prevent unwinding further and lay the reel about 20 feet from the antenna support. Position the radio set at the end of the antenna and insert the red plug of the antenna wire into the BNC connector of the amplifier/coupler. Set ANT SEL switch to the BNC (middle) position.

Figure A3-1. Dipole Antenna Kit

TABLE A3-1. ANTENNA LENGTH CHART

NOTE

Given length is for each leg of the dipole

Frequency (MHz)	Length (L) (Ft)	Frequency (MHz)	Length (L) (Ft)	Frequency (MHz)	Length (L) (Ft)
2.00	117	6.00	39	16.00	15
2.20	106	6.50	36	17.00	14
2.40	98	7.00	33	18.00	13
2.60	90	7.50	31	19.00	12
2.80	84	8.00	29	20.00	12
3.00	78	8.50	28	21.00	11
3.25	72	9.00	26	22.00	11
3.50	67	9.50	25	23.00	10
3.75	62	10.00	23	24.00	10
4.00	58	11.00	21	25.00	9
4.25	55	12.00	20	26.00	9
4.50	52	13.00	18	27.00	8
4.75	49	14.00	17	29.00	8
5.00	47	15.00	16	30.00	8
5.50	43				

4. Connect the black plug of the remaining antenna reel to the GND terminal. Unwind this wire and lay it on the ground in line with the antenna and in the opposite direction of the antenna support. Unwind the reel until it is about 1-1/2 times the antenna length and place the reel on the ground. (When the antenna is completely erected, this wire provides a counterpoise.)

5. Throw the lead weighted dacron cord over any convenient antenna support (such as a tree limb). Then fasten the cord reel to the antenna reel. Raise the antenna and fasten the cord to hold the antenna in place.

A3-5. DIPOLE ANTENNA. The dipole antenna is the most effective antenna and, time and tactical circumstances permitting, should be used in preference to either the whip or slant wire antenna. A dipole antenna is usually erected between two supports as shown in figure A3-3. Antenna supports are not provided with this equipment and it is not always possible to find two supports that are properly oriented and spaced. If only one support is available, or if terrain prohibits, a one-support dipole (figs. A3-4 and A3-5) should be used. Note that for both the dipole and slant wire antennas, the most effective receiving and transmitting direction is broadside, or 90° to the line of the wire. Erect a dipole antenna as follows.

1. Attach each dipole antenna wire to the dipole fixture (fig A3-6).

2. Determine the length of each leg of the dipole from the antenna length chart table A3-1.

3. Connect the coaxial lead-in of the feedline to the BNC connector of the amplifier/coupler. Set ANT SEL switch to the BNC (middle) position.

4. If two antenna supports are available, erect the antenna as illustrated in figure A3-3. If only one support is available, use the method shown in figures A3-4 and A3-5.

NOTE

In raising a horizontal dipole, considerable pull force may be required to raise a long antenna. It is recommended that no more than about 100 pounds pull be applied to the cords used to raise it, or the wire may break.

5. Try to select supports that will enable the height of the center of the dipole (sloping horizontal, or inverted) to be 1/3 of the leg length given in table A3-1, but never lower than about 10 feet. For example, at 6.0 MHz, the desired height would be $1/3 \times 39' = 13'$ above ground. This may not be possible at the lower frequencies so raise the antenna center as high as available supports will practically allow.

APPENDIX B

MAINTENANCE ALLOCATION

Section I. INTRODUCTION

B-1. General

This appendix provides a summary of the maintenance operations for the Radio Set AN/PRC-104(A). It authorizes categories of maintenance for specific maintenance functions on repairable items and components and the tools and equipment required to perform each function. This appendix may be used as an aid in planning maintenance operations.

B-2. Maintenance Function

Maintenance functions will be limited to and defined as follows:

- a. Inspect.* To determine the serviceability of an item by comparing its physical, mechanical, and/or electrical characteristics with established standards through examination.
- b. Test.* To verify serviceability and to detect incipient failure by measuring the mechanical or electrical characteristics of an item and comparing those characteristics with prescribed standards.
- c. Service.* Operations required periodically to keep an item in proper operating condition, i.e., to clean (decontaminate), to preserve, to drain, to paint, or to replenish fuel, lubricants, hydraulic fluids, or compressed air supplies.
- d. Adjust.* To maintain, within prescribed limits, by bringing into proper or exact position, or by setting the operating characteristics to the specified parameters.
- e. Align.* To adjust specified variable elements of an item to bring about optimum or desired performance.
- f. Calibrate.* To determine and cause corrections to be made or to be adjusted on instruments or test measuring and diagnostic equipments used in precision measurement. Consists of comparisons of two instruments, one of which is a certified standard of known accuracy, to detect and adjust any discrepancy in the accuracy of the instrument being compared.
- g. Install.* The act of emplacing, seating, or fixing into position an item, part, module (component or assembly) in a manner to allow the proper functioning of the equipment or system.
- h. Replace.* The act of substituting a serviceable like type part, subassembly, or module (component or assembly) for an unserviceable counterpart.

i. Repair. The application of maintenance services (inspect, test, service, adjust, align, calibrate, replace) or other maintenance actions (welding, grinding, riveting, straightening, facing, remachining, or resurfacing) to restore serviceability to an item by correcting specific damage, fault, malfunction, or failure in a part, subassembly, module (component or assembly), end item, or system.

j. Overhaul. That maintenance effort (service/action) necessary to restore an item to a completely serviceable/operational condition as prescribed by maintenance standards (i.e., DMWR) in appropriate technical publications. Overhaul is normally the highest degree of maintenance performed by the Army. Overhaul does not normally return an item to like new condition.

k. Rebuild. Consists of those services/actions necessary for the restoration of unserviceable equipment to a like new condition in accordance with original manufacturing standards. Rebuild is the highest degree of materiel maintenance applied to Army equipment. The rebuild operation includes the act of returning to zero those age measurements (hours, miles, etc.) considered in classifying Army equipments/components.

B-3. Column Entries

a. Column 1, Group Number. Column 1 lists group numbers, the purpose of which is to identify components, assemblies, subassemblies, and modules with the next higher assembly.

b. Column 2, Component/Assembly. Column 2 contains the noun names of components, assemblies, subassemblies, and modules for which maintenance is authorized.

c. Column 3, Maintenance Functions. Column 3 lists the functions to be performed on the item listed in column 2. When items are listed without maintenance functions, it is solely for purpose of having the group numbers in the MAC and RPSTL coincide.

d. Column 4, Maintenance Category. Column 4 specifies, by the listing of a "work time" figure in the appropriate subcolumn(s), the lowest level of maintenance authorized to perform the function listed in column 3. This figure represents the active time required to perform that maintenance function at the indicated category of maintenance. If the number or complexity of the tasks within the listed maintenance function vary at different maintenance categories, appropriate "work time" figures will be shown for each category. The number of task-hours specified by the "work time" figure represents the average time required to restore an item (assembly, subassembly, component, module, end item or system) to a serviceable condition under typical field operating conditions. This time includes preparation time, troubleshooting time, and quality assurance/quality control time in addition to the time required to perform the specific tasks identified for the maintenance functions authorized in the maintenance allocation chart. Subcolumns of column 4 are as follows:

- C - Operator/Crew
- O - Organizational
- F - Direct Support
- H - General Support
- D - Depot

e. Column 5, Tools and Equipment. Column 5 specifies by code, those common tool sets (not individual tools) and special tools, test, and support equipment required to perform the designated function

f. Column 6, Remarks. Column 6 contains an alphabetic code which leads to the remark in section IV, Remarks, which is pertinent to the item opposite the particular code.

B-4. Tool and Test Equipment Requirements (Sect. III)

a. Tool or Test Equipment Reference Code. The numbers in this column coincide with the numbers used in the tools and equipment column of the MAC. The numbers indicate the applicable tool or test equipment for the maintenance functions.

b. Maintenance Category. The codes in this column indicate the maintenance category allocated the tool or test equipment.

c. Nomenclature. This column lists the noun name and nomenclature of the tools and test equipment required to perform the maintenance functions.

d. National/NATO Stock Number. This column lists the National/NATO stock number of the specific tool or test equipment.

e. Tool Number. This column lists the manufacturer's part number of the tool followed by the Federal Supply Code for manufacturers (5-digit) in parentheses.

B-5. Remarks (Sect. IV)

a. Reference Code. This code refers to the appropriate item in section II, column 6.

b. Remarks. This column provides the required explanatory information necessary to clarify items appearing in section II.

SECTION IV. REMARKS

REFERENCE CODE	REMARKS
A	OPERATIONAL TEST.
B	TEST REQUIRED TO FAULT ISOLATE DEFECTIVE RT-1209, AM-6874, AM-7152, SA-2365 ASSEMBLIES/COMPONENTS OR WIRING PROBLEMS.
C	TEST REQUIRED TO FAULT ISOLATE DEFECTIVE MODULES, CIRCUIT CARDS, OR WIRING PROBLEMS.
D	REPAIR IS ACCOMPLISHED BY REPLACEMENT OF ASSEMBLIES/COMPONENTS OR CABLE ASSEMBLIES.
E	REPAIR IS ACCOMPLISHED BY REPLACEMENT OF MODULES, CIRCUIT CARDS, OR CABLE ASSEMBLIES.
F	THIS TASK CAN INCLUDE THE REPLACEMENT OF NONREPAIRABLE ASSEMBLIES (CABLE ASSEMBLY CG-3815()/U; ADAPTER UG-349()/U; BATTERY EXTENDER CABLE ASSEMBLY CX-13031, ANTENNA SPRING AB-129/PR, FRAME PACK FIELD, PACK SHELF, CARGO SHELF, HANDSET H-250/U, BATTERY CASE CY-7875, ANTENNA BASE AB-1241, TELEGRAPH KEY KY-872/PRC-104, WHIP ANTENNA AT-271, PRIMARY BATTERY BA-590/U, CARGO STRAP TIE-DOWN, CHARGER CABLE ASSEMBLY).
G	THIS TASK INVOLVES REMOVING EITHER THE RT-1209 OR AM-6874 FROM EITHER THE AM/GRC-213 OR AM/PRC-104A.
H	THIS TASK CAN INCLUDE THE REPLACEMENT OF A NONREPAIRABLE ASSEMBLY/PIECE PARTS.
I	THIS TASK WILL BE PERFORMED BY USMC DEPOT, ALBANY, GEORGIA.
J	THIS TASK INCLUDES THE REPLACEMENT OR BRINGING CURRENT CHEMICAL LEVELS WITHIN SPECIFIED STANDARDS. SEE TM 11-5820-919-12.
K	TEST REQUIRED TO FAULT ISOLATE TO DEFECTIVE MODULES, CIRCUIT CARDS, OR WIRING PROBLEMS.
L	SEE TM 11-5985-()-14&P FOR MAINTENANCE ALLOCATION.
M	SEE TM 11-5820-467-15 FOR MAINTENANCE ALLOCATION.
N	ALTHOUGH THE REPLACEMENT OF FUSE (F-1) IS PERFORMED AT GSM, THE CONFIGURATION DRAWINGS IDENTIFY THIS ITEM AS PART OF FGC 01010101.
O	SEE TM 11-5820-919-12 FOR MAINTENANCE ALLOCATION.

APPENDIX C

COMPONENTS OF END ITEM LIST

Section I. INTRODUCTION

C-1. Scope

This appendix lists integral components of and basic issue items for the AN/PRC-104(A) to help you inventory items required for safe and efficient operation.

C-2. General

This Components of End Item List is divided into the following sections:

a. Section II. Integral Components of the End Item. These items, when assembled, comprise the AN/PRC-104(A) and must accompany it whenever it is transferred or turned in. The illustrations will help you identify these items.

b. Section III. Basic Issue Items. These are the minimum essential items required to place the AN/PRC-104(A) in operation, to operate it, and to perform emergency repairs. Although shipped separately packed they must accompany the AN/PRC-104(A) during operation and whenever it is transferred between accountable officers. The illustrations will assist you with hard-to-identify items. This manual is your authority to requisition replacement BII, based on TOE/MTOE authorization of the end item.

C-3. Explanation of Columns

a. Illustration. This column is divided as follows:

- (1) *Figure number.* Indicates the figure number of the illustration on which the item is shown.
- (2) *Item number.* The number used to identify item called out in the illustration.

b. National Stock Number. Indicates the National stock number assigned to the item and will be used for requisitioning.

c. Part Number. Indicates the primary number used by the manufacturer, which controls the design and characteristics of the item by means of its engineering drawings, specifications, standards, and inspection requirements to identify an item or range of items. Following the part number, the Federal Supply Code for Manufacturers (FSCM) is shown in parentheses.

d. Description. Indicates the Federal item name and, if required, a minimum description to identify the item.

e. Location. The physical location of each item listed is given in this column. The lists are designed to inventory all items in one area of the major item before moving on to an adjacent area.

f. Usable on Code. Not applicable.

g. *Quantity Required (Qty Reqd)*. This column lists the quantity of each item required for a complete major item.

h. *Quantity*. This column is left blank for use during an inventory. Under the Rcvd column, list the quantity you actually receive on your major item. The Date columns are for your use when you inventory the major item at a later date; such as for shipment to another site.

APPENDIX D

ADDITIONAL AUTHORIZATION LIST

Section I. INTRODUCTION

D-1. Scope

This appendix lists additional items you are authorized for the support of the Radio Set AN/PRC-104(A).

D-2. General

This list identifies items that do not have to accompany the AN/PRC-104(A) and that do not have to be turned in with it. These items are all authorized to you by CTA, MTOE, TDA, or JTA.

D-3. Explanation of Listing

National stock numbers, descriptions, and quantities are provided to help you identify and request the additional items you require to support this equipment. The items are listed in alphabetical sequence by item name under the type document (i.e., CTA, MTOE, TDA, or JTA) which authorizes the item(s) to you.

SECTION II ADDITIONAL AUTHORIZATION LIST

(1) NATIONAL STOCK NUMBER	(2) DESCRIPTION	(3) UNIT OF MEAS	(4) QTY AUTH
	PART NUMBER AND FSCM	USABLE ON CODE	
6130-00-106-6445	BATTERY CHARGER PP-6241/U	EA	1

APPENDIX E

EXPENDABLE SUPPLIES AND MATERIALS LIST

Section I. INTRODUCTION

E-1. Scope

This appendix lists expendable supplies and materials you will need to operate and maintain the Radio Set AN/PRC-104(A). These items are authorized to you by CTA 50-970, Expendable Items (Except Medical, Class V, Repair Parts, and Heraldic Items).

E-2. Explanation of Columns

a. *Column 1 — Item Number.* This number is assigned to the entry in the listing and is referenced in the narrative instructions to identify the material (e.g., "Use cleaning compound, item 5, App. D").

b. *Column 2 — Level.* This column identifies the lowest level of maintenance that requires the listed item.

- C - Operator/Crew
- O - Organizational Maintenance
- F - Direct Support Maintenance
- H - General Support Maintenance

c. *Column 3 — National Stock Number.* This is the National stock number assigned to the item; use it to request or requisition the item.

d. *Column 4 — Description.* Indicates the Federal item name and, if required, a description to identify the item. The last line for each item indicates the part number followed by the Federal Supply Code for Manufacturer (FSCM) in parentheses, if applicable.

e. *Column 5 — Unit of Measure (U/M).* Indicates the measure used in performing the actual maintenance function. This measure is expressed by a two-character alphabetical abbreviation (e.g., ea, in, pr). If the unit of measure differs from the unit of issue, requisition the lowest unit of issue that will satisfy your requirements.

SECTION II EXPENDABLE SUPPLIES AND MATERIALS LIST

IN THIS SPACE TELL WHAT IS WRONG
AND WHAT SHOULD BE DONE ABOUT IT:

Recommend that the installation antenna alignment procedure be changed throughout to specify a 2° IFF antenna lag rather than 1°.

REASON: Experience has shown that with only a 1° lag, the antenna servo system is too sensitive to wind gusting in excess of 25 knots, and has a tendency to rapidly accelerate and decelerate as it hunts, causing strain to the drive train. Hunting is minimized by adjusting the lag to 2° without degradation of operation.

Item 5, Function column. Change "2 db" to "3db."

REASON: The adjustment procedure for the TRANS POWER FAULT indicator calls for a 3 db (500 watts) adjustment to light the TRANS POWER FAULT indicator.

Add new step f.1 to read, "Replace cover plate removed in step e.1, above."

REASON: To replace the cover plate.

Zone C 3. On J1-2, change "+24 VDC to "+5 VDC."

REASON: This is the output line of the 5 VDC power supply. +24 VDC is the input voltage.
